Preface

This document accompanies the delivery of Release B.0 Toolkit 5.2.1, Version 1.00. It is not a formal deliverable and does not require Government approval; however, it has been placed under configuration control by the EOSDIS Core System (ECS) Science Data Processing Segment. Changes to this document shall be made by document change notice (DCN) or by complete revision.

This Toolkit version is directed at Earth Observing System (EOS) instrument data providers who will deliver code to the ECS Release B.0 Distributed Active Archive Centers (DAACs). It is an engineering upgrade to Toolkit 5.2, delivered in April 1997. The user calling interface of the current version is the same as that of Toolkit 5.2.

Any questions regarding distribution should be addressed to:

Data Management Office
The ECS Project Office
Hughes Information Technology Systems

1. Introduction

1.1 Identification of Document

This document is a Version Description Document (VDD) prepared using NASA-STD-2100-91 as a guide. It is submitted as required for the Earth Observing System Data and Information System (EOSDIS) Core System (ECS), contract number NAS5-60000.

1.2 Scope of Document

This VDD specifies the delivery contents of the ECS Release B.0 Toolkit 5.2.1 Version 1.00 software and accompanying documentation.

1.3 Purpose and Objectives of Document

The purpose of this VDD is to describe the contents of the delivery of Release B.0 Toolkit 5.2.1 Version 1.00. The document briefly describes all tools that incorporate the delivery, provides an inventory of the delivery, lists unresolved problems, and addresses special issues such as special operating instructions, system limitations, and disclaimer notices for public domain software used in the library.

1.4 Document Status and Schedule

This Version Description Document for Release B.0 Toolkit 5.2.1 Version 1.00 is submitted as a final document. Any changes to Release B.0 Toolkit 5.2.1 Version 1.00 that require a subsequent version to be released will be described in a new Version Description Document.

1.5 Document Organization

The format and contents of this document comply with NASA-DID-P500 and NASA-DID-999 as defined in NASA-STD-2100-91.

- Introduction — Introduces the VDD scope, purpose, objectives, status, schedule and document organization.
- Related Documentation — Provides a bibliography of reference documents for the VDD organized by parent and binding subsections.
- Product Description — Describes the general capabilities and product contents.
- Inventory — Tar file listings for Release B.0 Toolkit 5.2.1 source and test drivers, documentation, and archive tape.

- Non-conformance Status — Discusses known problems with Release B.0 Toolkit 5.2.1 Version 1.00 and lists Non-conformance Reports with open status.
- Appendices — Contain supplemental information such as: Build/installation instructions, special operating instructions, system limitations, user feedback procedures, public software disclaimer notices, and the test baseline configuration.

2. Related Documentation

2.1 Parent Documents

The following documents are the parent from which this document's scope and content derive:

423-42-01	EOSDIS Core System Statement of Work- CN10
423-16-02	Science Data Processing (SDP) Toolkit Requirements Specification for the ECS Project

2.2 Applicable Documents

The following documents are directly applicable to this plan to the extent referenced herein. In the event of conflict between any of these documents and this plan, the plan shall take precedence.

170-TP-005-004	HDF-EOS Library Users Guide for the ECS Project--Volume 1: Overview and Examples
170-TP-006-003	HDF-EOS Library Users Guide for the ECS Project--Volume 2: Function Reference Guide
333-CD-004-002	Release B.0 Toolkit 5.2.1 Users Guide for the ECS Project
814-RD-009-002	HDF-EOS 2.1 Version Description Document (VDD) for the ECS Project
NASA-STD-2100-91	NASA Software Documentation Standard, Software Engineering Program

This page intentionally left blank.

3. Product Description

This section describes the general capabilities of Release B.0 Toolkit 5.2.1, Version 1.00, and the tools and test drivers provided.

3.1 Product Description and General Capabilities

The Release B.0 Toolkit 5.2.1 will be used by data production software developers and scientists to develop code at their Science Computing Facilities and later encapsulate that code in Distributed Active Archive Center computing facilities. The purpose of the Toolkit is to provide an interface between instrument processing software and the production system environment. It sets up the context and environment for the execution of production processes and the transfer of data sets and information to those processes. This interface will be implemented in the SCF development environment along with additional utilities that will be used to emulate production environment services.

An important goal of the Toolkit is to facilitate the smooth transition and integration of code into the DAAC by abstracting out science process dependencies on external system architecture. Another goal is the provision of an interface into which application modules can be incorporated. This may include, for example, geo-location packages, other specialized routines that can be Commercial-Off-The-Shelf, freeware or user supplied modules.

See Appendices A and F for further description of the installation scripts and the test baseline configuration.

The Toolkit Utilities and Ancillary data files are not part of the tool set but are part of this delivery. The Toolkit Utilities are ancillary data creation and file management utilities. They are provided to enhance the SCF development environment in lieu of an operational production environment. Additionally, the Ancillary/Auxiliary (AA) data access tools are provided. It is not necessary to install these files if users do not plan to use these tools.

3.2 Release B.0 Toolkit 5.2.1 Routine Listing

The following Release B.0 Toolkit 5.2.1 Routine listing provides a description of the tools.

Tool Name	Description
pccheck	Use to verify that a process control file (PCF) is syntactically correct
PGS_AA_2Dgeo	Allows access to 2 dimensional data sets e.g., sea-ice
PGS_AA_2DRead	Allows access to 2 dimensional data sets e.g., sea-ice
PGS_AA_3Dgeo	Allows access to 3 dimensional data sets, e.g., atmospheric humidity
PGS_AA_3DRead	Allows access to 3 dimensional data sets, e.g., atmospheric model
PGS_AA_dcw	Returns the surface types (land, sea, coast), and nation-state to be determined (TBD) for a user defined set of locations

Tool Name	Description (continued)
PGS_AA_dem	Locates heights from specified digital elevation model (DEM) corresponding to each of the locations specified
PGS_AA_PeVA_integer	Searches in a specified file for the parameter and returns the value of that parameter which is an integer
PGS_AA_PeVA_real	Searches in a specified file for the parameter and returns the value of that parameter which is a real(float)
PGS_AA_PeVA_string	Searches in a specified file for the parameter and returns the value of that parameter which is a text string
PGS_CBP_body_inFOV	Given instrument parameters, returns a flag to indicate whether any of the user-selected major celestial bodies (sun, moon, etc.) are in the instrument field-of-view.
PGS_CBP_BrightStar_positions*	Returns the position of all stars of magnitude > input magnitude, or the position of the stars designated by inputting star id's and setting the flag 'input_flag'.
PGS_CBP_Earth_CB_Vector	Computes the Earth centered inertial (ECI) frame vector from the Earth to the sun, moon, or planets at a given time, or range of time(s)
PGS_CBP_Sat_CB_Vector	Computes the ECI vector from the spacecraft to the sun, moon, or planets at a given time or range of time(s)
PGS_CBP_SolarTimeCoords	Computes local solar time, and right ascension and declination of the sun, for a given standard time and position on the surface of the Earth
PGS_CSC_DayNight	Determines whether a given point on the Earth is in day, night or twilight, at a given time
PGS_CSC_Earthpt_FixedFOV	For a fixed field of view obtains the Coordinated Universal Time (UTC) time interval and the starting time that an Earth point is within the field-of-view, within a specified time window
PGS_CSC_Earthpt_FOV	For a field of view defined by a table of coordinates (accessed externally), and a known motion of the boresight vector as a function of time, obtains the Coordinated Universal Time (UTC) time interval and the starting time that an Earth point is within the field-of-view, within a specified time window
PGS_CSC_ECItoECR	Frame change tool
PGS_CSC_ECItoORB	Transforms a vector in the ECI Coordinate system to a vector in the Orbital Coordinate System
PGS_CSC_ECItoSC	Frame change tool
PGS_CSC_ECRtoECI	Frame change tool
PGS_CSC_ECRtoGEO	Frame change tool
PGS_CSC_GEOtoECR	Frame change tool
PGS_CSC_GetFOV_Pixel	Computes the projection of (geolocates) the instrument field-of-view on the Earth, optionally, geolocates the center of each pixel in the footprint
PGS_CSC_GreenwichHour	Returns the Greenwich Hour Angle of the vernal equinox, which is equal to Greenwich sidereal time, in the ECI frame, at a given time.
PGS_CSC_J2000toTOD	Transform from ECI J2000 to ECI True Date
PGS_CSC_nutate2000	Transforms a vector under nutation from Celestial Coordinates of date in Barycentric Dynamical Time (TDB) to J2000 coordinates or from J2000 coordinates to Celestial Coordinates of date

Tool Name	Description (continued)
PGS_CSC_ORBtoECI	Transforms vector in orbital coordinate system to vector in ECI coordinate system
PGS_CSC_ORBtoSC	Frame change tool
PGS_CSC_precs2000	Precesses a vector from Celestial Coordinates of date in Barycentric Dynamical Time (TDB) to J2000 coordinates or from J2000 coordinates to Celestial Coordinates of date in Barycentric Dynamical Time (TDB)
PGS_CSC_SCtoECI	Frame change tool
PGS_CSC_SCtoORB	Frame change tool
PGS_CSC_SpaceRefract	Estimate the refraction for a ray incident from space or a line of sight from space to the Earth's surface, based on the unrefracted zenith angle
PGS_CSC_SubSatPoint	Returns the position and velocity vector of the sub-satellite point ("pierce point"), or nadir of the satellite on the Earth's surface. Optionally returns the nadir vector also.
PGS_CSC_TODtoJ2000	Transform from ECI True of Date to ECI J2000 Coordinates
PGS_CSC_wahr2	Calculates nutation angles
PGS_CSC_ZenithAzimuth	Returns zenith and azimuth angles of spacecraft
PGS_CUC_Cons	Accesses constant values from a predetermined input file
PGS_CUC_Conv	Accesses conversion slope and intercept values, needed to convert between units
PGS_DEM_Close	Close a DEM dataset
PGS_DEM_DataPresent	Check for Valid DEM Data Point
PGS_DEM_GetMetadata	Extract Metadata from the DEM
PGS_DEM_GetPoint	Return Data at Specified DEM Point
PGS_DEM_GetQualityData	ACCESS DEM Quality Data
PGS_DEM_GetRegion	Return Data from a Specified Region of the DEM
PGS_DEM_GetSize	Return Size of Specified DEM Region
PGS_DEM_Open	Open a DEM dataset
PGS_DEM_SortModels	Check for Data in a Specified Region of the DEM
PGS_EPH_EphemAttit	Provides access to spacecraft ephemeris and attitude data for a given time range, interpolates the state vectors and spacecraft attitude to a specified time
PGS_EPH_GetEphMet	Returns the metadata associated with spacecraft ephemeris files
PGS_GCT_Init	Performs Geo-coordinate transformation initialization for the given projection with the given parameters
PGS_GCT_Proj	Performs Geo-coordinate transformations for the given projection in the forward and inverse directions
PGS_IO_Gen_Close	Close non-HDF file
PGS_IO_Gen_CloseF	Close non-HDF file FORTRAN
PGS_IO_Gen_Open	Open non-HDF file
PGS_IO_Gen_OpenF	Open non-HDF file FORTRAN 77 & 90
PGS_IO_Gen_Temp_Delete	Permanently delete a temporary file
PGS_IO_Gen_Temp_Open	Open temporary file
PGS_IO_Gen_Temp_OpenF	Open temporary file FORTRAN 77 & 90
PGS_IO_L0_Close	Closes a virtual data set that was opened with a call to PGS_IO_L0_Open.
PGS_IO_L0_File_Sim	Creates a file of simulated Level 0 data

Tool Name	Description (continued)
PGS_IO_L0_GetHeader	Gets the header and footer data for the currently open physical file
PGS_IO_L0_GetPacket	Gets a single packet from the specified Level 0 Virtual Data Set
PGS_IO_L0_Open	Open a Virtual Level 0 Data Set
PGS_IO_L0_SetStart	Sets the specified open virtual data set so that the next call to PGS_IO_L0_GetPacket will read the first packet at or after the specified time
PGS_IO_L0_SetStartCntPkts	Sets the specified open virtual data set so that the next call to PGS_IO_L0_GetPacket will read the first packet at or after the specified time and tracks the number of packets skipped in the current file.
PGS_MEM_Calloc	Allocates an array of arbitrarily sized elements, initializing them to zero, in memory
PGS_MEM_Free	Deallocates memory that was previously allocated
PGS_MEM_FreeAll	Deallocates all memory that was previously allocated within a process
PGS_MEM_Malloc	Allocates an arbitrary number of bytes in memory
PGS_MEM_Realloc	Reallocates the number of bytes requested
PGS_MEM_ShmAttach	Used by an executable to attach to an existing shared memory segment
PGS_MEM_ShmCreate	Used to create a shared memory segment
PGS_MEM_ShmDetach	Used to detach a shared memory segment from a process that attached it
PGS_MEM_ShmRead	FORTTRAN Read from Shared Memory
PGS_MEM_ShmWrite	FORTTRAN Write to Shared Memory
PGS_MEM_Zero	Initializes a memory block or structure to zero
PGS_MET_GetConfigData	Enables the user to get the values of Config data parameters held in the PC table
PGS_MET_GetPCAttr	Retrieves parameter values from the PC table which are either located as HDF attributes on product files or in separate ASCII files
PGS_MET_GetSetAttr	Enables the user to get the values of metadata parameters which are already set by the initialization procedure
PGS_MET_Init	Initializes a metadata configuration file (MCF)
PGS_MET_Remove	Contains PGS_MET_Remove() which frees the memory held by the metadata configuration file (MCF) and data dictionary object description language (ODL) representations
PGS_MET_SetAttr	Enables the user to set the value of metadata parameters
PGS_MET_Write	Enables the user to write different groups of metadata to separate HDF attributes
PGS_PC_GenUniqueID	Used to generate a unique product identifier. May be attached to file metadata to facilitate tracking of production output
PGS_PC_GetConfigData	May be used to access run-time parameters in-the PGE
PGS_PC_GetConfigDataCom	May be used to access run-time parameters at the shell level
PGS_PC_GetFileAttr	Used to retrieve the attribute string that contains the metadata for a Product file
PGS_PC_GetFileAttrCom	Used at the shell level to retrieve an attribute "stream" that contains the metadata for a Product file
PGS_PC_GetFileByAttr	Used to retrieve the specific instance of a product file that satisfies the search criteria, defined by a user-supplied method, applied to the metadata of each product file instance
PGS_PC_GetFileSize	Get the size of a file in the PCF.

Tool Name	Description (continued)
PGS_PC_GetFileSizeCom	Get the size of a file in the PCF at the shell level.
PGS_PC_GetNumberOfFiles	May be used to query the number of file instances that are associated with a particular product file
PGS_PC_GetNumberOfFilesCom	May be used, at the shell level, to query the number of file instances that are associated with a particular product file
PGS_PC_GetReference	Used to obtain a physical file pathname from a logical identifier for a particular Product file
PGS_PC_GetReferenceCom	Used at the shell level to obtain a physical file pathname from a logical identifier for a particular Product file
PGS_PC_GetReferenceType	Tool may be used to ascertain the type of file reference which is associated with a logical identifier within the science software
PGS_PC_GetTempReferenceCom	Used at the shell level to obtain a physical file pathname from a logical identifier for a particular Temporary, or Intermediate file
PGS_PC_GetUniversalRef	Used to obtain a universal reference from a logical identifier
PGS_PC_InitCom	Used, prior to PGE execution, to establish a working environment for the SDP Toolkit
PGS_PC_Shell.sh	Provides an integrated environment for the SDP Toolkit and a PGE
PGS_PC_TempDeleteCom	Used at the shell level to delete the Temporary file currently associated with a particular logical identifier
PGS_PC_TermCom	Used, following PGE termination, to cleanup the resources used by the SDP Toolkit
PGS_SMF_Begin	Signal SMF that function has started
PGS_SMF_CreateMsgTag	May be used to generate a unique message identifier
PGS_SMF_End	Signal SMF that function has ended
PGS_SMF_GenerateStatusReport	Used to add user-defined status reports to the Status Report Log file
PGS_SMF_GetActionByCode	Provide the means to retrieve an action string associated with a specific mnemonic code
PGS_SMF_GetInstrName	Used to retrieve the instrument name from a given error/status code
PGS_SMF_GetMsg	Provide the means to retrieve a previously set message from the static buffer PGS_SMF_Set....
PGS_SMF_GetMsgByCode	Provide the means to retrieve the message string corresponding to a specific mnemonic code
PGS_SMF_GetToolkitVersion	This function returns a string describing the current version of the Toolkit.
PGS_SMF_SendRuntimeData	Provide a means for the user to transmit a package of runtime data to the SCF in the event of an unhandled system exception
PGS_SMF_SetArithmeticTrap*	Used to specify a signal handling function to perform in the event that an error arithmetic operation has occurred.
PGS_SMF_SetDynamicMsg	Provide the means to set a user-defined error/status message in response to the outcome of some segment of processing.
PGS_SMF_SetHDFMsg*	Provide the means to retain the HDF-EOS error message as a result of an HDF-EOS error.
PGS_SMF_SetStaticMsg	Provide the means to set a predefined error/status message in response to the outcome of some segment of processing.
PGS_SMF_SetUNIXMsg	Provides the means to retain UNIX error messages for later retrieval
PGS_SMF_TestErrorLevel	Will return a Boolean value indicating whether or not the returned code has status level 'E'
PGS_SMF_TestFatalLevel	Will return a Boolean value indicating whether or not the returned code has status level 'F'

Tool Name	Description (continued)
PGS_SMF_TestMessageLevel	Will return a Boolean value indicating whether or not the returned code has status level 'M'
PGS_SMF_TestNoticeLevel	Will return a Boolean value indicating whether or not the returned code has status level 'N'
PGS_SMF_TestStatusLevel	Will return a defined status level constant
PGS_SMF_TestSuccessLevel	Will return a Boolean value indicating whether or not the returned code has status level 'S'
PGS_SMF_TestUserInfoLevel	Will return a Boolean value indicating whether or not the returned code has status level 'U'
PGS_SMF_TestWarningLevel	Will return a Boolean value indicating whether or not the returned code has status level 'W'
PGS_TD_ASCIItime_AtoB	Converts binary time values to ASCII Code B time values of the form year_month_day_time_of_day in the Consultative Committee on space Data Systems (CCSDS) format
PGS_TD_ASCIItime_BtoA	Converts binary time values to ASCII Code A time values of the form year_month_day_time_of_day in the CCSDS format
PGS_TD_GPStoUTC	Converts to Coordinated Universal Time (UTC) time value from Global Positioning System (GPS) time by converting to internal time, adding the GPS_minus_UTC_leapseconds from the leapseconds file, and converting to GPS format following CCSDS ASCII standard A
PGS_TD_LeapSec	Find Leap second value
PGS_TD_SCTime_to_UTC	Converts spacecraft clock time to UTC for EOS platforms or for foreign spacecraft
PGS_TD_TAItoGAST	Converts International Atomic Time (TAI) (toolkit internal time) to Greenwich apparent sidereal time (GAST) expressed as the hour angle of the true vernal equinox of date at the Greenwich meridian (in radians)
PGS_TD_TAIjdttoTAI	Converts TAI Julian date to time in TAI seconds since 12 AM UTC 1-1-1993
PGS_TD_TAItoTAIjd	Converts time in TAI seconds since 12 AM UTC 1-1-1993 to TAI Julian date
PGS_TD_TAItoUTC	Converts TAI time value to UTC time
PGS_TD_TimeInterval	Computes the elapsed TAI time in seconds between any two epochs after January 1, 1958
PGS_TD_UTCtoGPS	Converts UTC time value to GPS time by converting to internal time, adding the GPS_minus_UTC_leapseconds from the leapseconds file, and converting to GPS format following CCSDS ASCII standard A
PGS_TD_UTCtoTAI	Converts UTC time to TAI time by first converting UTC to internal time and then adding the TAI_minus_UTC_leapseconds from the leapseconds file
PGS_TD_UTCtoTDBjd	UTC to Barycentric Dynamical Time (TDB) time conversion
PGS_TD_UTCtoTDTjd	UTC to Terrestrial Dynamical Time (TDT) time conversion
PGS_TD_UTCtoUT1	Converts UTC to UT1 time
PGS_TD_UTCtoUT1jd	Converts UTC time in CCSDS ASCII Time Code to UT1 time as a Julian date
PGS_TD_UTCjdttoUTC	Converts UTC as a Julian date to UTC in CCSDS ASCII Time Code A format
PGS_TD_UTCtoUTCjd	Converts UTC in CCSDS ASCII Time Code A format to UTC as a Julian date

Tool Name	Description (continued)
PGS_TD_UTC_to_SCtime	Converts UTC to Spacecraft clock time for EOS standard of Foreign Spacecraft
smfcompile	Provides means to store messages in files that are accessed at runtime to get the message text.

* Undelivered at this time; please see the Release B.0 SCF Toolkit Users Guide.

3.3 Release B.0 Toolkit 5.2.1 Test Tools and Drivers

Included in the delivery of Release B.0 Toolkit 5.2.1 Version 1.00 are sample drivers for each toolkit routine or set of routines. These drivers are provided “as is” as an aid to the Toolkit Users. These drivers have been used during the integration and test process and may be useful to verify installation, debug errors encountered while using the toolkit, or as sample routines for calling the toolkit functions. They are provided as a service to the toolkit users and will not be maintained or updated.

The drivers are contained in a separate tar file named SDPTK5.2.1v1.00_TestDrivers.tar.Z. The file contains a driver for each tool or set of related tools (such as Generic I/O), a “Readme file” describing how to compile and use the drivers for each tool group, a makefile for each tool group, sample output files and sample input files for the drivers. In addition to the “Readme file”, the drivers and sample files are well commented to aid the user in correct usage. This is the only documentation that will be delivered for the drivers. To access the sample drivers, untar the file, read the desired readme, set the environment, make the desired driver and run. The files in the sample driver directory (test_drivers) follow the following naming convention:

1) Driver Name:

C Driver: tool_name_Driver_c.c

Fortran Driver: tool_name_Driver_f.f

(Example: PGS_CBP_Earth_CB_Vector_Driver_c.c)

or for a tool group with one driver: tool_group_name_Driver_c.c and tool_group_name_Driver_f.f (ex: PGS_GCT_Driver_f.f)

The _c and _f in the name prevents name conflicts between the C and FORTRAN in the executables.

2) README file: README.<tool group name>.

The README file explains how to use drivers. The README file also contains all the environment variables needed to be set to run the driver, with some examples of values for those variables.

The make instruction assumes the Toolkit Libraries are available and the Toolkit environmental variable have been set, for example:

\$PGSLIB points to the toolkit library

\$PGSINC points to the include files

3) Sample output: <Driver_Name>.out_sample

4) Sample input file: Driver_Name.in

The drivers have been implemented to be used either interactively (requiring user inputs) or driven by an input file. All of the tools can operate in both modes. The sample output was obtained by running the tool from the provided input file. Repeating this process and comparing the output with the sample file may be useful in validating proper installation or porting of the toolkit. Using the interactive capabilities or modifying the input file to fit the values encountered during your integration may help to debug errors encountered while using the toolkit.

3.4 Release B.0 Toolkit 5.2.1 Hierarchical Data Format

The Hierarchical Data Format (HDF) has been selected by the EOSDIS Project as the format of choice for standard product distribution. HDF is a *disk format* and *subroutine library* for storage of most kinds of scientific data. As a *disk format*, HDF files consist of a directory and an unordered set of binary data objects. Each directory entry describes the location, the type, and the size of these binary objects.

The *HDF subroutine library* is designed to be easy for C and Fortran programmers to use. The HDF library consists of callable routines, each of which belongs to a particular *interface*. Each interface within these layers address a particular HDF function or a particular HDF data structure, such as arrays, tables, and annotations.

3.5 Release B.0 SCF Toolkit Users Guide

The purpose of the *Release B.0 SCF Toolkit Users Guide* is to provide EOS instrument data processing software developers and scientists with knowledge of Release B.0 Toolkit 5.2.1 functionality, and to provide a listing of routine calling sequences, detailed descriptions, and examples of usage. This document accompanies the software delivery described in Sections 3.2, 3.3, and 3.4 above.

4.4 Documentation

The document provided with this release is:

Document Number: 333-CD-004-002
 Title: Release B.0 SCF Toolkit Users Guide for the ECS Project
 Delivery Source: Hardcopy, WEB

4.5 Archive Tape

The following magnetic tape is used to archive the delivered baseline configuration of the developed software.

904-PR-036-003

Label: ECS RELB TOOLKIT 5.2.1 v1.00
 Distribution Date: Oct 29, 1997

5. Non-Conformance Status

5.1 Known Problems with Release B.0 Toolkit 5.2.1

This section contains the list of problems closed (Section 5.2) and known problems (Section 5.3) as of 10/28/97 in the Release B.0 Toolkit 5.2.1 Version 1.00 delivery. These problems were found and recorded during unit and integration testing or discovered by users of the previous version of the Toolkit and captured in the formal problem tracking system, Distributed Defect Tracking System (DDTS). The DDTS system generated the attached list of “closed” NCRs. This list has been reviewed by HITC management and Release Toolkit is considered to be acceptable for delivery at this time. The list includes the NCR ID, Title, Description, and Status. DDTS Problem Severity Definitions, on a 1-5 scale, are defined as follows:

- 1 Catastrophic and unrecoverable!
Example: system crash or lost user data.
- 2 Severely broken and no workaround.
Example: can't use major product function.
- 3 A defect that needs to be fixed but there is a workaround.
Example: user data must be modified to work.
- 4 A defect that causes small impact. Easy to recover or workaround.
Example: error messages aren't very clear.
- 5 Trivial defect or enhancement request.
Example: bad layout or misuse of grammar in manual.

5.1.1 Installed Changes

This VDD addresses the additional capabilities and modifications to problems found in the Release B.0 Toolkit 5.2 software.

- Addition of interpolation functionality for the DEM tools
- Update of Metadata tools to conform with the B0 changes to the data model
- Perform bug fixes
- Update of Installation scripts to conform to current SGI compiler.
- Conform to ODL standards regarding UTC date and time
- Conform with HDF-EOS version 2.0
- Conform with USNO data leap seconds-they do not recommend or support predicted leap seconds
- Conform with latest EDOS ICD processing Level 0 files.

- Update of three freeware packages: udunits, Gctp, and cfortran.h to the latest version.
- Update to support C++ access to C routines even though this is not a mandatory requirement.

The status of the NCRs corrected for this release is included in section 5.2. This NCR report reflects the information obtained from DDTs on October xx, 1997. To obtain a detailed description of the NCRs, the DDTs system can be accessed from the following WEB page:

<http://newsroom.gsfc.nasa.gov/ddts/>

5.2 Release B.0 Toolkit 5.2.1 Non-Conformance Reports (Close Status)

The following Toolkit open problems, listed in numerical order by severity were closed with the Release B.0 Toolkit 5.2.1 delivery:

NCR ID: ECSed09375

Title: PGS_EPH_GetEphMet core dumps on all platforms

Severity: 1

Description: PGS_EPH_GetEphMet core dumps on all platforms when the PGS_EPH_GetEphMet_Driver is run. Debugging efforts are underway to determine whether this is a driver or tool problem. If determined that this is a driver problem, the severity of this NCR will be downgraded.

Resolution: The line:

totalOrbits+1);

was modified to:

(totalOrbits+1)*sizeof(PGSt_ephemMetadata));

This ensures that the appropriate amount of memory is allocated for the array of structures that this memory area is being used to store.

NCR ID: ECSed07338

Title: ProductionDateTime not set when write .met file

Severity: 2

Description: When Ingest calls ..PGS_MET_WRITE to write the populated MCF file (.met) the PRODUCTIONDATETIME field is not being set.

Resolution: Fixed the code for setting up the attribute ProductionDateTime by calling the UNIX system time. It is now also available when writing the Meta data to an ASCII file using this function in which the mdHandle argument, the first input parameter of the function PGS_MET_Write() is not the group name of INVENTORYMETADATA.

file changed: /ecs/formal/TOOLKIT/src/MET/tools/PGS_MET_Write.c

NCR ID: ECSed07731

Title: Inputpointer Attribute length not sufficient

Severity: 2

Description: Inputpointer attribute length was not long enough. During SSI&T input file names are concatenated together to form the input pointer. Only a few input files made this extremely large and caused a toolkit error.

Langley TTID: Id000175

Resolution: The PGSD_PC_UREF_LENGTH_MAX definition in PGS_PC.h & PGS_PC.f has been increased from 150 to 255.

NCR ID: ECSed07732

Title: Temporary File Name Creation Disagrees with PDPS Implementation

Severity: 2

Description: There is an error in function PGS_IO_Gen_Temp_Name() where the actual naming of files occurs. To create a unique name within a DAAC, the local IP address of the science computing platform is used along with time/date stamp and the production run identifier. During development of this software, an assumption was made as to the format of these IP addresses. The assumption was that the last 2 tokens were fixed at 2 characters apiece. This is incorrect since it does not agree with the internet protocol. In actuality, all of the tokens that represent an IP address are variable from 1 to 3 characters (1 to 254 decimal).

Another component of the temporary file name is the Data Processing Request (DPR) Id. This Id maps to the instance of a PGE run and to the PGE version ID itself. Unfortunately, at the time of TK development and documentation, this value was to have a limit of 8 numeric characters; we believe that this limit was reached based on the number of jobs which would be generated per day, per site. Today, we understand that this value can be as large as 27 characters and contain collection time information (10 characters in width) in addition to the PGE version id (which is 17 characters in width). This also is a potential problem for the Toolkit I/O tools which use array sizes of 10 for the Production Run ID.

These early design assumptions do not agree with the current implementation of the Testbed, which generates the larger DPR id, and forces the use of correct IP addresses within the PCF. This mismatch between the Toolkit and the PDPS can result in the PGE creating temporary files which it cannot subsequently read. Eventhough the file may appear to have been created, and the filename agrees with that reported in the PCF (from visual inspection), the filename may actually contain non-printable characters as a result of the Toolkit exceeding some array bounds.

- Resolution:**
- 1) The Production Run Id will be dropped as a component of the file name; this component does not increase the uniqueness of the file and was originally introduced to provide for additional traceability to the process which created the file. Since this information is already captured in the Failed PGE diagnostic tar file, where the temporary files would be stored, it was considered to be redundant and unnecessarily increased the width of the file name; originally 8 characters in width, the DPR identifier was increased to 27 to provide more information to the production operator.
 - 2) The full decimal encoded form of the IP address will be used (sans the "." delimiters, but padded with 0 within each byte field)

So, for example, 198.118.192.17 will become 198118192017. If this were reduced
 - 3) Also, to make analysis of temporary I/O problems easier, the width of all temporary file names will be fixed at 31 characters.

Final note: in actuality, the IP address is no longer necessary, as long as temporary intermediate files (i.e., those whose names are generated by the Toolkit, not "interim" files which are defined prior to runtime) will NEVER be inserted to the Data Server as discrete granules; the original design concern was that intermediate file names would clash in the archive. However, for the sake of evolvability, should the ECS system ever support archival of temporary data types, the Toolkit will continue to incorporate the IP address of the science computing platform (note that at the SCF, any address may be used as long as it conforms to the internet standard; at the DAAC, the address is retrieved from the system by the Toolkit).

NCR ID: ECSed07939

Title: Simulator must be altered to produce different attitude rates

Severity: 2

Description: Per decision of Larry Klein at request of Dan Marinelli, the spacecraft attitude rate variables will now stand for inertial rates, not rates in the orbital system. (For a nadir looking spacecraft, pitch will run a constant decrease at the orbital rate). The simulator now produces 0 rates for such spacecraft.

This fix is itself a dependency on changes in DPREP and the documentation for the attitude tool PGS_EPH_EphemAtt(). Because the change will occur in DPREP, the tool PGS_EPH_EphemAtt() itself will not change - only the documentation and the simulator need to change.

Resolution: The function PGS_EPH_TransformBodyRates() has been created to handle the required transformation (see attachment "Analysis").

Body rates generated by the orbit simulation utility "orbsim" will now represent inertial rates projected on the body axes (rates WERE orbital rates).

NCR ID: ECSed08864

Title: bug in utcpole.dat update program

Severity: 2

Description: The software that updates the Toolkit file utcpole.dat has a bug. When updating the file, if the date of the USNO source file contains a day of month less than 10 the header of the resulting utcpole.dat file is 1 character short of what the Toolkit expects it to be.

Since the Toolkit searches through the file by byte offset, this renders the file useless to the Toolkit.

Resolution: The file header was coming out 1 character short when the day of month was single digit. This was due to the code's having too short a string of blanks imbedded in it and used to pad the date and time. The string was made larger by several blank characters, which fixed the problem.

Additional code was written to check the lengths of the two header lines and abort the run with a diagnostic to the log file in case of error.

The first line is 99 characters including the newline, and the first two together, the entire header, 168, including 2 newlines.

NCR ID: ECSed08906

Title: Error in SMF logging control

Severity: 2

Description: Users cannot disable logging of PGSDM_ status messages via the logging control mechanism of the Process Control File. Nor can they disable any of their own status messages (on an individual status message basis).

e.g., the following line in the Process Control File is ineffectual:

```
10119|Disabled          status          code          mnemonic
list|PGSDM_M_FILLVALUE_INCLUDED
```

This entry should prevent the status message PGSDM_M_FILLVALUE_INCLUDED from appearing in any Toolkit log files, but it doesn't work. It seems only to be broken in the case of DEM tools; all other Toolkit tool groups can have their various error messages disabled in this way.

Resolution: Fixed code in PGS_SMF_DecodeCode to recognize the Toolkit group DEM. This allows the Toolkit to do a lookup on DEM status code mnemonics. This function PGS_SMF_DecodeCode is in the file PGS_SMF.c.

Added code to the function PGS_SMF_InitializeLogging() to allow users to disable logging of SMF status codes by providing the actual (numeric) code (rather than just the mnemonic as was previously the case).

NCR ID: ECSed08907

Title: PGS_PC_Shell.sh ignores twos-compliments

Severity: 2

Description: PGS_PC_Shell.sh ignores twos-compliments of various error codes returned by PGS_PC_InitCom. For example a return status of 247 indicates that shared memory was not properly initialized and in some cases this should terminate PGS_PC_Shell.sh before it attempts to invoke a PGE. On some platforms, however, a value of 247 returned by an executable will be treated by the shell as -9. PGS_PC_Shell.sh is not checking for a value of -9, only the value of 247. It should check for both values when making a decision on what action to take based on the return code from PGS_PC_InitCom.

Resolution: The script PGS_PC_Shell.sh now checks for both the usual expected return codes and the twos-compliment of those return codes, before deciding what action to take following the call to PGS_PC_InitCom.

NCR ID: ECSed09005

Title: Inputpointer Attribute length not sufficient

Severity: 2

Description: Inputpointer attribute length was not long enough. During SSI&T input file names are concatenated together to form the input pointer. Only a few input files made this extremely large and caused a toolkit error.

Langley TTID: Id000175

Resolution: The PGSD_PC_UREF_LENGTH_MAX definition in PGS_PC.h & PGS_PC.f has been increased from 150 to 255.

NCR ID: ECSed09006

Title: Temporary File Name Creation Disagrees with PDPS Implementation

Severity: 2

Description: There is an error in function PGS_IO_Gen_Temp_Name() where the actual naming of files occurs. To create a unique name within a DAAC, the local IP address of the science computing platform is used along with time/date stamp and the production run identifier. During development of this software, an assumption was made as to the format of these IP addresses. The assumption was that the last 2 tokens were fixed at 2 characters apiece. This is incorrect since it does not agree with the internet protocol. In actuality, all of the tokens that represent an IP address are variable from 1 to 3 characters (1 to 254 decimal).

Another component of the temporary file name is the Data Processing Request (DPR) Id. This Id maps to the instance of a PGE run and to the PGE version ID

itself. Unfortunately, at the time of TK development and documentation, this value was to have a limit of 8 numeric characters; we believe that this limit was reached based on the number of jobs which would be generated per day, per site. Today, we understand that this value can be as large as 27 characters and contain collection time information (10 characters in width) in addition to the PGE version id (which is 17 characters in width). This also is a potential problem for the Toolkit I/O tools which use array sizes of 10 for the Production Run ID.

These early design assumptions do not agree with the current implementation of the Testbed, which generates the larger DPR id, and forces the use of correct IP addresses within the PCF. This mismatch between the Toolkit and the PDPS can result in the PGE creating temporary files which it cannot subsequently read. Eventhough the file may appear to have been created, and the filename agrees with that reported in the PCF (from visual inspection), the filename may actually contain non-printable characters as a result of the Toolkit exceeding some array bounds.

Resolution: The following modifications are required to correct the problem with temporary file name generation:

- 1) The Production Run Id will be dropped as a component of the file name; this component does not increase the uniqueness of the file and was originally introduced to provide for additional traceability to the process which created the file. Since this information is already captured in the Failed PGE diagnostic tar file, where the temporary files would be stored, it was considered to be redundant and unnecessarily increased the width of the file name; originally 8 characters in width, the DPR identifier was increased to 27 to provide more information to the production operator.
- 2) The full decimal encoded form of the IP address will be used (sans the "." delimiters, but padded with 0 within each byte field). So, for example, 198.118.192.17 will become 198118192017 if this were reduced.
- 3) Also, to make analysis of temporary I/O problems easier, the width of all temporary file names will be fixed at 31 characters.

Final note: in actuality, the IP address is no longer necessary, as long a temporary intermediate files (i.e., those whose names are generated by the Toolkit, not "interim" files which are defined prior to runtime) will NEVER be inserted to the Data Server as discrete granules; the original design concern was that intermediate file names would clash in the archive. However, for the sake of evolvability, should the ECS system ever support archival of temporary data types, the Toolkit will continue to incorporate the IP address of the science computing platform (note that at the SCF, any address may be used as long as it conforms to the internet standard; at the DAAC, the address is retrieved from the system by the Toolkit).

NCR ID: **ECSed09045**

Title: Error parsing EDOS L0 construction record
Severity: 2
Description: The toolkit fails to read EDOS L0 files (i.e. recently acquired files that actually were produced by EDOS). It seems to be failing while parsing the construction record.
Resolution: The Toolkit source code was modified to read item 25-2 of the Construction Record as 40 bytes rather than 36 bytes.

NCR ID: ECSed09121

Title: Toolkit MET tool core dumps when retrieving a string value from container
Severity: 2
Description: The GetPCAttr causes a core dump when attempting to retrieve a string value (which is actually a double value) from a container attribute in an ASCII file. This also occurs for the reverse case. The test driver input is as follows:

operation: getpc_string
file number: 10284
version #: 1
HDF attribute: GRANULE_HDFOUT_5724
Attribute name: GRINGPOINTLATITUDE.1

operation: getpc_double
file number: 10284
version #: 1
HDF attribute: GRANULE_HDFOUT_5724
Attribute name: AutomaticQualityFlag.1

Resolution: Tester should input proper operation for PGS_MET_GetPCAttr to retrieve the attribute, such as:

- 1 Retrieving of the attribute contains the double type of value from the metadata file, the operation of getpc_double should be set up
2. Retrieving of the attribute contains the string type of value from the metadata file, the operation of getpc_string should be set up

NCR ID: ECSed09168

Title: Error on install on the SGI (orbsim.c)
Severity: 2

Description: When attempting to install the toolkit on the SGI in any of the modes, the following error occurs when building the additional utilities:

build the orbit simulator & s/c ephemeris check utilities...

```
cc -32 -c -O -xansi -D_POSIX_SOURCE -DIRIX -

```

Error occurred while attempting to compile toolkit utilities. The following tool groups had compilation errors:

EPH

Error occurred while attempting to clean up toolkit object files

INSTALL-Toolkit completed with errors at Tue Oct 14 10:40:11 EDT 1997

INSTALL: Error: The Toolkit Installation Script failed or had errors. SDP Toolkit installation cancelled

Resolution: This problem only manifested during a Toolkit installation. The apparent

problem was that the SGI would build the tool group CBP to the library libPGSTK.a and then immediately start compiling the CSC tool group. On occasion (for whatever reason). This would cause the first one or two files compiled in the CSC tools to have a system time EARLIER than the library file libPGSTK.a EVEN THOUGH that file was last modified BEFORE any files were compiled in the CSC tool group and therefore SHOULD have the earlier modification (system) time.

The problem was worked around by altering the toolkit library archiving script "mkpgslib" to sleep for one second after adding a batch of object file to the library. This seems to give the system enough time to ensure that it does not confuse the time of library file modification and the time of the creation of any of the object files from the follow on tool group which are created immediately following the library update.

NCR ID: ECSed09442

Title: PGS_MET_GetPCAttr core dumps on SGI (32-bit modes), HP, and DEC

Severity: 2

Description: The MET tool PGS_MET_GetPCAttr was found to be the cause of the core dumps on all 32-bit modes on the SGI and on the HP and DEC platforms. Development has already looked into the problem and a fix has been informally given to test.

Resolution: Changed the variable zone_hours, Zone hours from GMT (-12 - +12), that defined as a data type of long to be the data type of short.

NCR ID: ECSed09512

Title: MET tools return error instead of success on HP and SUN5 platform

Severity: 2

Description: On the HP and SUN5 platforms only, the MET tools return an error code instead of a success as follows where "<" represents actual output and ">" represents expected output (development has been given all data needed):

HP:

PGS_MET_Driver_c

5504c5504

Resolution: There is no problem with the Toolkit, after recompiling the MET library, the same output were generated in TestDriver on SUN5 and HP.

NCR ID: ECSed06175

Title: GCT is having minor differences on the 64bit version

Severity: 3

Description: On the 64bit version (f77 and f90) differences are appearing for the GCT tools in the proj operation.

Resolution: A conditional compilation condition was added to the code so that on the SGI the C type "int" is used to read data from disk. This ensures (for the moment) that the data is read as 4-byte quantities (see attachment "Analysis").

NCR ID: ECSed06176

Title: The AA tool dcw is returning diff. values on the 64 bit version

Severity: 3

Description: The AA dcw driver is having differences on the 64 bit version. All the other platforms are okay.

Resolution: DEVELOPER: The output is same as sample output after testing on the 64 bit version of Lasher and Relbsgi

TESTER: The problem no longer exists. Ran the PGS_AA_dcw_Driver in 64bit mode on relbsgi and does not give any differences.

NCR ID: ECSed06190

Title: Diff in SHM MEM tool on Power Challenge only

Severity: 3

Description: The SHM_MEM tools is returning a different error message on the Power Challenge 32bit and 64bit than the other platforms.

Resolution: Using the debugger it was verified that the errno is being set after the call to shmget (UNIX call to initialize shared memory). The errno being set is 22 which corresponds to EINVAL.

From the SGI man page for shmget:

EINVAL size is less than the system-imposed minimum or greater than the system-imposed maximum.

This is exactly the error condition being tested for and the error is exactly what one would expect.

Unable to reproduce error as stated in attachment "Problem".

NCR ID: ECSed06191

Title: On new32bit f90 getting a bus error for the IO tools

Severity: 3

Description: On the new32bit f90 version only getting a core dump (bus error) for the IO_Driver. It is running input file 2 through the PGS_Perm_IO_Driver_f90

Resolution: Modified PGS_Perm_IO_Driver_f90.f as follows:

changed line 180 from "character msg*240" to "character msg*340"

NCR ID: ECSed06193

Title: SCtimetoUTC time and UTCtoSCtime having diffs. on power challenge

Severity: 3

Description: There are differences in the SCtime to UT and the UT to SCtime drivers in the f77 version of the 64bit and new32bit on the power challenge this in on lasher at
/data3/ecs/OPS/CUSTOM/bin/scf_64f77/TOOLKIT/test/test_drivers/TD

Resolution: This is a driver problem, not a Toolkit problem. The values returned by the toolkit seem to be OK. The output of the driver is inconsistent with the sample output. The problem seems to be in formatting HEXIDECIMAL numbers for output.

Suggest replacing syntax like:

ichar(scTime(1:1))

with:

scTime(1:1)

in write statements in test drivers.

Note: There will be another NCR written against the driver.

NCR ID: ECSed06666

Title: Different results for AA_dem_interger on the DEC

Severity: 3

Description: On the DEC only different results are occurring for the AA_dem_interger points just outside of corner test

Resolution: Added code that calls the function memset() to assign the value of 0 for the point is not located in the DEM

NCR ID: ECSed06668

Title: The HP is experiencing different results for 2 AA_dem tests

Severity: 3

Description: The HP is getting different results for 2 AA_dem tests and all the other platforms are getting the expected output

Resolution: Added code that calls the function memset() to assign the value of 0 for the point is not located in the DEM

NCR ID: ECSed07259

Title: MODIS PGE unable to access Gring metadata attributes

Severity: 3

Description: The Toolkit does not allow the user to retrieve a container attribute value from an ASCII Metadata file.

Resolution: Changed code to enable the user to retrieve the container attribute value from an ASCII Metadata file. The problem was the original code did not provide the procedure to check whether the attribute is a class attribute or not files changed:

`$PGSHOME/src/MET/tools/PGS_MET_GetPCAttr.c`

`$PGSHOME/src/MET/tools/PGS_MET_GetPCAttrF.c`

NCR ID: ECSed07260

Title: INSTALL-Toolkit Fails for SGI f90 v7.1

Severity: 3

Description: The INSTALL-Toolkit script for the v5.1.1 SDP Toolkit fails when run using the SGI f90 v7.1 compiler. The script verifies the compiler type (NAG or SGI f90) by executing the f90 command without arguments. A switch statement then uses the error message returned by the compiler to determine the compiler type.

The message returned by the v7.1 f90 compiler is two lines, and results in a "buf" variable value of "WARNING f90". This text string is not included in the switch statement, and so the INSTALL-Toolkit procedure thinks that the wrong compiler has been specified.

A case statement for the new string has been added locally, but needs to be added to the delivered SDP Toolkit package.

Resolution: The toolkit install script has been modified to set the SGI_ABI environment variable temporarily before testing the f90 compiler. This should ensure that even for users who have not configured their f90 compiler to default to allowed binary types (i.e. n32 or 64 bit) there will not be a problem running the Toolkit installation scripts.

NCR ID: ECSed07282

Title: Toolkit does not support ODL standard regarding UTC date and time

Severity: 3

Description: The Toolkit could not retrieve attribute data values that are in the ODL UTC DATETIME format without double quotes. This does not match the ODL standard

Resolution: Added code enabling the datetime data that is not in the type of string but in the type of UTC DATETIME format without double quotes surrounding it can be retrieved from memory files changed:

`$PGSHOME/src/MET/tools/PGS_MET_GetSetAttr.c`

`$PGSHOME/src/MET/tools/PGS_MET_GetSetAttrF.c`

`$PGSHOME/src/MET/tools/PGS_MET_GetPCAttr.c`

`$PGSHOME/src/MET/tools/PGS_MET_GetPCAttrF.c`

NCR ID: ECSed07283

Title: Class value in group is not consistent with class value in object section

Severity: 3

Description: For the GRing Group, the Class = "1" parameter is not being set by toolkit
More generally: class value in the Group section is not consistent with the class value in the Object section

Resolution: Fixed code in order the class value in Group can be consistent with the class value of Object in the Metadata file

file changed: /ecs/formal/TOOLKIT/src/MET/support/PGS_MET_CheckAttr.c

NCR ID: ECSed07382

Title: Toolkit5.2 can not pre-set attributes within containers

Severity: 3

Description: I've run into a case where the SDP TK 5.2 PGS_MET tools are functioning as designed, but where I believe the design needs to be changed.

Currently, the PGS_MET routines do not allow for granule level attributes within an ODL Container object to be hard coded in an MCF. Any hard coded attribute values within ODL Containers (i.e., where Data_Location = "MCF" and Value is provided) are currently ignored. If Data_Location = "MCF" is encountered within a Container, the current design is for the SDP TK to change "MCF" to "PGE" and ignore the specified Value. The SDP TK PGS_MET design needs to be modified to allow Data_Location + "MCF" within ODL Container objects.

This issue came up in RCC testing using a Landsat-7 ESDT descriptor file and MCF using a GRing definition having pre-set Values for ExclusionGRingFlag and GRingPointSequenceNo. I carefully read through the SDP TK 5.2 Users Guide and I couldn't find any comment that users should not use Data_Location = "MCF" within ODL Containers. It is very possible that Instrument Teams will use SDP TK 5.2 with preset Values within Containers, get error messages and report it to 'pgstlkit' as a bug. ITs should be allowed to pre-set some attribute values within ODL Containers. Making a SDP TK mod to allow for this will reduce the amount of PGS_MET_SetAttr calls the science software must make. This issue affects the following B.0 Data Model classes which may appear within Version 2 science software MCFs: GPolygon/GRing, MeasuredParameter, OrbitCalculatedSpatialDomain, Review, SensorCharacteristic, AssociatedPlatformInstrumentSensor, which all contain at least one attribute that an Instrument Team would be justified in thinking they could be pre-set.

The current SDP TK PGS_MET already allows for MCF hard coding of attribute values if the attribute is not within an ODL Container. Examples of this are

ShortName and VersionID which are pre-set in the ESDT descriptor (from which the MCF is created) and these attributes and their values do appear in the resulting *.met files.

I'm also not even certain whether this current design has been implemented correctly for attributes within ODL Containers, since in one RCC test GRing attributes which were hardcoded in the MCF did not even show up at all in the resulting *.met file (the current design implies they'd appear with Value = "NOT SET").

Resolution: Changed code to recognize the class value that is not only the character "M", PGSD_MET_MULTIPLE_FLAG, but also can be any numerical number, such as 1, 2, 3, or 11 that has already pre-set in the MCF file. SAME AS NCR# 7385.

NCR ID: ECSed07385

Title: Toolkit5.2 can not pre-set attributes within containers

Severity: 3

Description: The SDP TK 5.2 PGS_MET tools are functioning as designed, but the design needs to be changed.

Currently, the PGS_MET routines do not allow for granule level attributes within an ODL Container object to be hard coded in an MCF. Any hard coded attribute values within ODL Containers (i.e. where Data_Location = "MCF" and Value is provided) are currently ignored. If Data_Location = "MCF" is encountered within a Container, the current design is for the SDP TK to change "MCF" to "PGE" and ignore the specified Value. The SDP TK PGS_MET design needs to be modified to allow Data_Location + "MCF" within ODL Container objects.

This issue came up in RCC testing using a Landsat-7 ESDT descriptor file and MCF using a GRing definition having pre-set Values for ExclusionGRingFlag and GRingPointSequenceNo. I carefully read through the SDP TK 5.2 Users Guide and I couldn't find any comment that users should not use Data_Location = "MCF" within ODL Containers. It is very possible that Instrument Teams will use SDP TK 5.2 with preset Values within Containers, get error messages and report it to 'pgstlkit' as a bug. ITs should be allowed to pre-set some attribute values within ODL Containers. Making a SDP TK mod to allow for this will reduce the amount of PGS_MET_SetAttr calls the science software must make. The current SDP TK PGS_MET already allows for MCF hard coding of attribute values if the attribute is not within an ODL Container. Examples of this are ShortName and VersionID which are pre-set in the ESDT descriptor (from which

the MCF is created) and these attributes and their values do appear in the resulting *.met files.

I'm also not even certain whether this current design has been implemented correctly for attributes within ODL Containers, since in one RCC test GRing attributes which were hardcoded in the MCF did not even show up at all in the resulting *.met file (the current design implies they'd appear with Value = "NOT SET").

Resolution: Changed code to recognize the class value that is not only the character "M", PGSD_MET_MULTIPLE_FLAG, but also can be any numerical number, such as 1, 2, 3, or 11 that has already pre-set in the MCF file.

NCR ID: ECSed07451

Title: Extracting DEM data is very inefficient

Severity: 3

Description: Informed by MODIS that speed of extracting data is prohibitively slow. Inefficiency mostly concerns tool PGS_DEM_GetRegion.

Resolution: Added the function PGS_DEM_AccessFile() to DEM tools. This function opens, closes and keeps a record of the staged files. It's primary purpose is to improve the efficiency of the DEM tools. Previously, everytime a file was accessed, it needed to be opened and the GRID needed to be attached. This function allows these files to be opened and the GRIDS to be attached only once in the DEM functionality. There are three modes, or commands, which regulate the functionality of PGS_DEM_AccessFile:

PGSD_DEM_ACCESS -- In this case, the particular file has been opened and the GRID has been attached outside of this function. The hdfID and gdID's already have been assigned to the particular subgrid of the subset. In this case, the function merely records the file specific info.

PGSD_DEM_OPEN -- This function determines if a file has been opened and attached. If it has, it assigns the file info to the subgrid. If the file has not been opened, it is opened, attached to, and the file info is recorded both in the subset and internally to this function.

PGSD_DEM_CLOSE -- This function closes and detaches from all of the files of a particular subset.

calls to this function were made in the following DEM functions:

PGS_DEM_GetQualityData.c,

PGS_DEM_RecursiveSearchDeg.c,

PGS_DEM_RecursiveSearchPix.c,

PGS_DEM_Populate.c, PGS_DEM_GetMetadata.c,

PGS_DEM_Subset.c

NCR ID: ECSed07452

Title: DEM: error retrieving data type with PGS_DEM_GetSize

Severity: 3

Description: PGS_DEM_GetSize improperly returns the variable sizeDataType (which is the number of bytes in one pixel of data). This improper return occurs when more than one layer is opened by PGS_DEM_Open.

Resolution: The function PGS_DEM_GetSize was modified by Alexis Zubrow (lines 116-131) in PGS_DEM_GetSize.c file to take care of the problem.

NCR ID: ECSed07728

Title: Zero is not allowed as a valid Product ID when using shared memory

Severity: 3

Description: Load shared memory to use both Product ID and file name as NULL to indicate a problem with the PCF data line.

Files affected:

PGS_PC_InitCom.c

PGS_PC_TermCom.c

PGS_PC_GetFileFromShm.c

Resolution: When loading file information to shared memory the NULL value is used for both Product ID and filename to indicate a bad entry in the PCF. This allows for the user to still use zero (0) as a valid Product ID.

Changes were made in the following source files:

PGS_PC_InitCom.c

PGS_PC_TermCom.c

PGS_PC_GetFileFromShm.c

NCR ID: ECSed07730

Title: Integerized Sinusoidal Projection In GCTP

Severity: 3

Description: Support for the Integerized Sinusoidal Projection was added to the General Cartographic Transformation Package (GCTP) used by HDF-EOS 2.0, delivered in April. (see section 6.5 of the HDF-EOS Users Guide Vol 1).

This projection was not added to the SDP Toolkit 5.2 GCT tools. The GCT tools are needed to transform lat/lon to this projection. We will correct this oversight

shortly by making the fix available in the same way we did with the June 18 fixes and we will include it in the DAAC Toolkit and next SCF Toolkit update.

- Resolution:**
1. Coyied functions `isinusfor()` and `isinusinv()` that were designed by Robert Wolfe (STX) and Raj Gejjagaraguppe (SAC) and modified the error/status message by calling the Toolkit SMF functions.
 2. Modified the function `PGS_GCT_Init()` to include the functionality of processing the new projection type called Integerized Sinusoidal Grid.
 3. Modified the function `PGS_GCT_Proj()` to add two function declaration for `isinusfor()` and `isinusinv()`.
 4. Added two error/status messages `PGSGCT_E_ISIN_ERROR` and `PGSGCT_E_DMS_ERROR` for `PGS_GCT_12.t` and recompiled to rebuild the header files `PGS_GCT_12.h` and `PGS_GCT_12.f`.
 5. Added one new header file `isin.h` in the `/ecs/formal/TOOLKIT/include/FW`.
 6. modified the makefile (`/ecs/formal/TOOLKIT/src/GCT/freeware`) to include the new functions `isinusfor()` and `isinusinv()`

NCR ID: ECSed07758

Title: PGEs need to get metadata from HDF files in B.0

Severity: 3

Description: In B.0, PGEs need to have the choice of getting metadata from the HDF file or from the Target MCF. Archive metadata will only be in the HDF file, so the source of this data must be the HDF file in such cases.

Very important as a B.0 fix. May impact chaining of MODIS PGEs in the Testbed. (More in NCR)

- Resolution:**
1. Added code to set up a flag `hdfattrnameflag` to be `PGS_TRUE` if the HDF attribute name if equal to `productmetadata.X` or `archivemetadata.X`,
where `.x` is a sequence number beginning at 0 and running as high as 9
 2. Added code to set `HDFflag` to be `PGS_TRUE` if the attribute of the file associated with the particular ID and version contains `".met"` and the filename associated with the logical identifier and version number is a HDF file existing in the same directory as the ASCII metadata file `.met` is
 3. Added code to set signature specially for retrieving the archive metadata from the HDF file when the user sets up the first parameter `"fileId"`, file id for the file containing parameter data is the ASCII metadata file `.met` file
 4. Added code get a `aggNode` specially for retrieving the archive metadata from the HDF file when the user sets up the first parameter `"fileId"`, file id for the file containing parameter data is the ASCII metadata file `.met` file

NCR ID: ECSed07875

Title: MODIS PGE08 fails due to DATETIME data type in metadata
Severity: 3
Description: MODIS PGE08 does not work. Insert of the output file for ESDT MOD29 fails with an error message indicating that ODL data type DATETIME is invalid for metadata attributes such as RangeBeginningDateTime.
Resolution: Added code to DsCIIMF::CheckMetafileAttrs :
DATETIME is now allowed as a data type in the Toolkit template MCF. It is treated as a string.

NCR ID: ECSed07887

Title: MODIS PGE unable to access Gring metadata attributes
Severity: 3
Description: The Toolkit does not allow the user to retrieve a container attribute value from an ASCII Metadata file.
Resolution: Changed code to enable the user to retrieve the container attribute value from an ASCII Metadata file. The problem was the original code did not provide the procedure to check whether the attribute is a class attribute or not (Dup of ECSed07259)

NCR ID: ECSed07888

Title: SDP ToolKit is not working.
Severity: 3
Description: Messages passed to PGS_SMF_SetDynamicsMsg are being lost. (See J. Davis for more details.) No fatal errors produced by a PGE are written to LogStatus.
Resolution: This is most likely not a bug. The Process Control File (PCF) being used most likely has disabled logging of fatal (_F_) level status messages. This is done in the PCF via the line:

10117|Disabled status level list (e.g. W S F)|

If this line looks like:

10117|Disabled status level list (e.g. W S F)|F

then status messages with a status level of fatal (_F_) will not be logged. This is documented in the Toolkit users guide in section:

6.2.2.1.4 Status Level Control.

By removing the 'F' character from the end of the PCF entry shown above, fatal messages will be logged to the Toolkit status log file. This is a feature, not a bug.

NCR ID: ECSed08395

Title: Problem with FORTRAN Temp IO tool

Severity: 3

Description: These two problems are related:

This is Toolkit user support log number 970619:

I have encountered the following problem with the Release A version of the toolkit. I had never used PGS_IO_Gen_Temp_OpenF before, but at delivery it looks like we will need to do this. When I make my fortran call

```
ierr=pgs_io_gen_temp_openf(PGSd_IO_Gen_Endurance,42998,PGSd_IO_Gen_
WSeqFrm,0,MOPDiag_unit) I get back:
```

```
ierr= 11792 Attempt to do FORTRAN Open with STATUS=OLD failed! Now
with an open for write, the file should NOT exist. When I put an empty file in the
correct location, I get back:
```

```
ierr= 11279 File exists! Changing access mode from Write to Update. This
verifies that my PCF file is set up properly. Is there a bug in this routine?
```

—AND—

When I try to open a file listed in the INTERMEDIATE OUTPUT section of the PCF, the Toolkit is unable to find the logic id. I've tried using the duration=1 flag in the open routine, but that doesn't help.

Is the INTERMEDIATE OUTPUT section of the PCF searched for logic ids when a file is opened? I assume that it should be, but it appears not to be. I've also had trouble with the INTERMEDIATE INPUT section.

Resolution: THIS NCR really points out two errors, one is a user error and one is a Toolkit design flaw (bug in the code).

1) USER ERROR The proper use of the Toolkit Temp IO tools is to NOT put a name in the Process Control File (PCF). The problems reported by the users (see attachment "Problem") are due to the users attempting to "determine" the name of the temp file that they would like to use and adding an entry to the PCF for this logicalID / file name before running their PGEs.

This is an incorrect procedure. The Toolkit GENERATES temporary file names AT RUNTIME. Users may not choose temporary file names. Furthermore, the Toolkit adds the file entry to the PCF AT RUNTIME. If a filename already exists in the PCF for a given logical ID in the Temporary output section of the PCF, the Toolkit assumes that IT has already generated this file and therefore that the file ALREADY exists on disk (the Toolkit does NOT actually check to see if the file already exists since by design no entry can exist in the PCF unless the file has ALREADY been created.

The solution to the users' problems is to simply delete any entries they may have added to their PCF for Temporary (INTERMEDIATE) output files.

2) TOOLKIT BUG

This turns out to be an error in the Toolkit code. The erroneous code is in the file PGS_PC_GetPCFTemp.c located in the Toolkit src directory under the PC sub-directory (\$PGSHOME/src/PC).

The source code in the file PGS_PC_GetPCFTemp.c was modified to allow for the case that the environment variable PGS_PC_INFO_FILE is set to a file ONLY (as opposed to a file PATH and a file NAME).

The test for a '/' character has been removed as a critical test of whether or not the variable PGS_PC_INFO_FILE has been properly set. The case that this variable is set to just a file name is now handled gracefully.

An instance of assigning an integer to a string formatting character in a printf() statement has been removed.

NCR ID: ECSed08858

Title: Toolkit SGI flag -ansiposix is obsolete

Severity: 3

Description: The Toolkit uses the compiler flag "-ansiposix" on the SGI. According to the documentation (man page) for the latest SGI C compiler, this flag is obsolete:

-ansiposix

(ANSI/ISO C only) Same compilation environment as -ansi with the additional preprocessor definition of _POSIX_SOURCE. This is a pure ANSI/ISO environment, and __STDC__ is defined with this option as well as with the -ansi option.

WARNING: This option is obsolete and will be removed in future releases. See the below section on API's for information on getting a POSIX-compliant compile.

Resolution: The use of the flag -ansiposix was replaced with the flags -xansi-D_POSIX_SOURCE in the files:

INSTALL-Toolkit, pgs-dev-env.csh.tmp, pgs-dev-env.ksh.tmp.

NCR ID: ECSed08859

Title: Link error in INSTALL-Toolkit script

Severity: 3

Description: The Toolkit script INSTALL-Toolkit erroneously creates a link called earthfigure.dat in \$PGSDAT/CSC which points to utcpole.dat in \$PGSHOME/database/common/CSC. The link SHOULD point to earthfigure.dat in \$PGSHOME/database/common/CSC.

Resolution: The Toolkit script INSTALL-Toolkit now correctly creates a link called earthfigure.dat in \$PGSDAT/CSC which points to earthfigure.dat in \$PGSHOME/database/common/CSC.

NCR ID: ECSed08861

Title: The TK script INSTALL has logic errors

Severity: 3

Description: The Toolkit script INSTALL has the following logic errors:

- 1) If the user chooses NOT to install HDF both the HDF and HDF-EOS sections of the script are skipped. The script later tries to access the shell variable "hdfeos_installed" which in this case is never defined. This causes the script to bomb out.
- 2) If no sgi mode is specified to the INSTALL script on an IRIX64 platform the script says the default installation is 64 bit mode but it then compiles in OLD 32 bit mode.

Resolution:

- 1) the shell variable hdfeos_installed is initialized to indicate that HDF-EOS has NOT been installed prior to the section of the script that checks for HDF installation.
- 2) the shell variable sgi_mode is appropriately set to indicate the actual installation mode desired. An additional flag of -sgi has been added to the INSTALL script for those users who are interested in installing in old 32 bit mode directly.

NCR ID: ECSed08862

Title: SMF "repeating message" log error

Severity: 3

Description: I ran into a bug in the SDP Toolkit. Here is a vastly simplified piece of source code which displays the same symptoms:

```
SMFtest.c=====
#include <stdio.h>
#include <stdlib.h>
#include "PGS_MODIS_39501.h"
#include "PGS_SMF.h"

int main(void)
{
```

```

PGSt_SMF_status ret;

int i;

for(i=0; i<9; i++)
{
    ret = PGS_SMF_SetDynamicMsg(MODIS_E_CALLOC_FAIL, "Repeat
message",
    "SMFtest.c main");
    if(ret != PGS_S_SUCCESS)
        return EXIT_FAILURE;
}

ret = PGS_SMF_SetDynamicMsg(MODIS_U_NO_INFORMATION, "Final
message",
    "SMFtest.c main");
return ret==PGS_S_SUCCESS ? EXIT_SUCCESS : EXIT_FAILURE;
}

```

=====

build command:

```

cc $CFLAGS SMFtest.c -I$PGSINC -L$PGSLIB -lPGSTK -o SMFtest
SMFtest

```

echo \$status

The return status was 0, and the Status Log contents were:

=====

BEGIN_PGE: Wed Aug 13 13:43:38 1997

MSG_TAG: 11

FILE: /cc/cc_vob/INHOUSE/PGE01/MOD_PR03/output/LogStatus

LOGGING: status message logging enabled

TRACE_LEVEL: tracing disabled

PID_LOGGING: disabled

TOOLKIT_VERSION: SCF B.0 TK5.2

SMFtest.c main():MODIS_E_CALLOC_FAIL:323595783

Repeat message

SMFtest.c main():MODIS_E_CALLOC_FAIL - 8 additional occurrences

SMFtest.c main():MODIS_U_NO_INFORMATION:323594273

Final message

SMFtest.c main():MODIS_E_CALLOC_FAIL - 8 additional occurrences

=====

Where did the extra 8 MODIS_E_CALLOC_FAIL messages come from? How did they come after what should have been the "final message"? In my testing, I found this problem occurring only if the two messages are different types. If they were both _E_ messages, it didn't occur. This may be specific to version 5.2; I only just started using that version. I don't remember seeing this problem in similar circumstances using 5.1. I've never used version 5.1.1.

further note:

The problem actually only occurs with messages of status level _U_ or _N_ as the "final message" (see above).

Resolution: The problem only occurs with status levels _U_ and _N_, which are special status levels used to log messages to the Toolkit user log. The problem occurs if a status message is logged multiple times and then followed by a logging of an _N_ or _U_ level message.

The SMF code does not properly handle the writing of repeated messages in this case. The code writes the repeated message notation into the status log as expected, then it writes the newly logged message. However in the case of _N_ or _U_ level messages the code enters a section where it again logs the message into the Toolkit user log. At this point it again writes the repeated message notation into the Toolkit status log.

The source code of module PGS_SMF_WriteLog() (in file PGS_SMF.c) was modified. Repeat message logging is now handled correctly.

NCR ID: ECSed08877

Title: MODIS PGE08 fails due to DATETIME data type in metadata

Severity: 3

Description: Insert of the output file for ESDT MOD29 fails with an error message indicating that ODL data type DATETIME is invalid for metadata attributes such as RangeBeginningDateTime.

Resolution: This is a duplicate of ECSed07875.

NCR ID: ECSed08878

Title: AA freeform determines file type thru filename extension

Severity: 3

Description: TOOLKIT AA freeform software determines the type of file based on filename extension. IMF Data Server concatenates a tag to the filename when inserted to ensure uniqueness. This means that AA freeform software cannot correctly determine the file type.

This problem was detected during SSIT activity for ASTER ACVS PGE.

Resolution:

***** Rel B resolution (Added 971001 by elarson) *****

This is not a problem for Rel B. This problem arose with the ASTER ACT PGE, which uses its own versions of Toolkit AAdat files. The testbed chose to put these files on the IMF and acquire them when the PGE ran.

For the August Demo, Rel B PDPS chose to statically install these files in a different location from the default versions of the files. The PCF for this PGE then simply pointed to this different location.

As far as we know this ASTER PGE is the only PGE that uses its own versions of these files. The total size of the files is a few MB, so there is no potential problem with disk space in PDPS. The plan for DAAC operations is to also install the ASTER PGE specific versions of these files in their own location and point to them in the PCF for that PGE. There is no data server involvement in the use of these files in Rel B and thus the changes made for the testbed do not need to be applied.

NCR ID: ECSed08880

Title: GRINGPOINTSEQUENCENO object type conflict

Severity: 3

Description: The TOOLKIT template MCF used by the IMF specifies the type for the GRINGPOINTSEQUENCENO object to be STRING. Unfortunately, the document that was sent out to the instrument team specifies this object to be of type INTEGER.

Resolution: Changed the GRINGPOINTSEQUENCENO object's type from a STRING to an INTEGER in the IMF data dictionary file.

NCR ID: ECSed08912

Title: Error parsing disabled status mnemonics list in PCF

Severity: 3

Description: The SMF tools do not properly parse the list of disabled status code mnemonics in the PCF.

i.e., the following line (from a hypothetical PCF) is not properly parsed:

```
10119|Disabled status code mnemonic list|PGSTD_E_NO_LEAP_SECS  
PGSTD_M_ASCII_TIME_FMT_B
```

(this was discovered while examining the code in a debugger, there has not up until this point been any real side effect of this other than a some slow down in the code, put it is potentially dangerous)

Resolution: The intervening white space is now accounted for. The comma character is now also allowed as an item separator in the list.

NCR ID: ECSed08976

Title: GCT tools require update

Severity: 3

Description: The Toolkit GCT tool group should be updated to use the gctp package being maintained by the HDF-EOS developers. This should be done in such a way that the results of the Toolkit calls are not affected (unless they were erroneous in the first place).

Resolution: Due to the calling sequence is different between the gctp package being maintained by the HDF-EOS developer and gctp package being maintained by the TOOLKIT for projection UNIVERSAL TRANSVERSE MERCATOR Easting and Northing or vice versa

Created a new function PGS_GCT_SetGetrMajorrMinor to save the semi-major axis and semi-minor axis values for projection UTM(UNIVERSAL TRANSVERSE MERCATOR) in order those values can be retrieved by the function PGS_GCT_Proj()

Added status message checking for all functions existing on the freeware directory that were replaced to use the gctp package being maintained by the HDF-EOS developer. The return status message in this package is using the UNIX standard I/O function that is different from the original package that calls the Toolkit functions to handle all return status messages Added code to calculate the ZONE number from the given input Longitude value and obtain the semi-major axis and semi-minor axis values from by calling the PGS_GCT_SetGetrMajorrMinor, a function to set or retrieve major and minor axis values, in order ZONE, semi-major and semi-minor axis values can be passed into the lower functions, utmforint() and utminvint() that will be called in the function PGS_GCT_Proj() instead of being called in the function PGS_GCT_Init()

NCR ID: ECSed08977

Title: MET Write tool should write ALL PGE metadata

Severity: 3

Description: Currently the MET tool PGS_MET_Write() enforces the writing of all metadata attributes in the Metadata Configuration File (MCF) that have a data location of "PGE" and whose mandatory parameter is set to TRUE.

The mandatory parameter is actually irrelevant in this case, this is not a proper test of whether or not metadata should be written out. The PGE should set values for ALL metadata contained in the MCF with a data location of "PGE". The MET tools should return a warning if ANY metadata parameter specified in the MCF with a data location of "PGE" has not been set by the PGE.

Resolution: Modified the source code to remove all aggregate nodes in the ODL tree only for the data location is MCF, TK, DSS, DP, or DAAC and the Mandatory set to false

Added code to generate a return warning message for any metadata parameter specified in the MCF with a data location of "PGE" has not been set by the PGE

NCR ID: ECSed08979

Title: EPH metadata tools reports same orbit twice

Severity: 3

Description: The EPH metadata retrieval tool PGS_EPH_GetEphMet(), which returns (among other things) a count of orbits spanned by the input time range, counts orbits twice under some circumstances (if data crosses file boundaries?).

In these cases it is reporting, e.g., number of orbits = 3 and the orbit numbers as (e.g.) 10, 10, 11.

Resolution: A check was added on each record of metadata retrieved from the physical files containing ephemeris data to ensure that duplicate metadata records are not returned to a user. This fix was done to the file PGS_EPH_GetEphMet.c.

NCR ID: ECSed09042

Title: HDF data for DEM tools needs to be reproduced with new metadata

Severity: 3

Description: HDF data files do not include new metadata. They need to be reproduced for 30ARC and 3ARC data sets.

Resolution: A new metadata descriptor and MCF file created for 3ARC and 30ARC data results. They were used to write metadata into HDF data files.

NCR ID: ECSed09081

Title: Write the ASCII .met file to the product/data directory

Severity: 3

Description: This implementent will allow the MODIS01 PGE to work

Resolution: Modified the source code to write .met files to the product/data directory instead of writing to the runtime (cureent working) directory

NCR ID: ECSed09114

Title: Write ASCII .MET files to the product/data directory

Severity: 3

Description: This change will allow the MODIS01 PGE to work

Resolution: The function PGS_MET_Write() has been modified to write ASCCI .met files to the produc/tdata directory instead of writing to the runtime (current working) directory

NCR ID: ECSed09178

Title: Toolkit does not properly copy over files during installation

Severity: 3

Description: PGS_PC_Shell.sh is missing from TOOLKIT/bin/\$BRAND. The file is not being copied over during installation

Resolution: The target PGS_PC_Shell was added to the list of utilities to be built for the Toolkit group PC (as defined by the makefile for that group).

NCR ID: ECSed09220

Title: PGS_MET_GetPCAttr failure after PGS_MET_Remove

Severity: 3

Description: There two problems are related:

This is Toolkit user support log number 970929:

I find that with TK5.1.1 and TK5.2 (but not TK5.1), if pgs_met_init has been called twice, even if PGS_MET_Remove was called in between, PGS_MET_GetPCAttr (which calls PGS_MET_GetSetAttr) will fail. It returns PGSMET_E_DD_UNKNOWN_PARM I believe.

To clarify a previous message I sent last week, PGS_MET_GetPCAttr seems to fail if called after PGS_MET_Remove is called. Here is a short demonstration program. The result with toolkit 5.2 is:

Note: variable read is set to -42 before calling PGS_MET_GetPCAttr.

Called PGS_MET_Init, returnStatus = 0

Called PGS_MET_GetPCAttr, returnStatus = 0, ORBITNUMBER.1 = 1

Called PGS_MET_Remove

Called PGS_MET_GetPCAttr, returnStatus = 0, ORBITNUMBER.1 = -42

(The second call to PGS_MET_GetPCAttr returns success but does not actually alter the variable it is supposed to set.)

Resolution: Deleted the source code in the function PGS_MET_Remove() that frees the memory of aggregate node PGSG_MET_AggList held by the metadata configuration file (MCF)

NCR ID: ECSed09222

Title: A defect in retrieving the Attribute of Date and Time values

Severity: 3

Description: A defect was found after retrieving the attribute value of DateTime, 2001-01-31, when testing the LandSat7 data of CPF files from IAS. The value displayed after retrieving is 2001-01-31T0:00:00

Resolution: In the original source code, a flag secondiszero is set up to be TRUE to indicate the zone time is equal to 0 but there is no code to handle the output value that is to be retrieved if the flag of secondiszero is equal to TRUE

Modified the source code to handle the output value that is to be retrieved if the flag of secondiszero is equal to TRUE

NCR ID: ECSed09301

Title: Change the Flag set up for archive HDF attribute to inventory

Severity: 3

Description: A error will be produced if the input HDF attribute name for the non-inventory is other than the string "archivemetadata.N" or "productmetadata.N" (N=0...n)

Resolution: Modified the source code in function PGS_MET_GetPCAttr() that set hdfattrnameflag to be PGS_TRUE if the HDF attribute name is equal to productmetadata.X or archivemetadata.X, where .x is a sequence number beginning at 0 and running as high as 9 to set hdfattrnameflag to be PGS_TRUE if the HDF attribute name is equal to coremetadata.X where .x is a sequence number beginning at 0 and running as high as 9

NCR ID: ECSed09310

Title: It never set valid flag to false

Severity: 3

Description: I found there is a bug in /ecs/formal/TOOLKIT/src/CUC/ODL/cvtvalue.c which is the routine to convert ODL to datetime and at the same time to do validation on datetime attribute. When it found the data's year is out of range. It never set valid

flag to false. I need to check this flag to check if this date is OK or not. But I can't checkout to do modification because it is restricted from the main branch. Can you tell me who is responsible for this?

Resolution: Added code to set vaild flag defined to check whether year is outside expected range or not to be 0 if it is in false case.

NCR ID: ECSed09316

Title: PGS_EPH_GetEphMet() returns wrong orbit information

Severity: 3

Description: The function PGS_MET_GetEphMet() does not return the appropriate orbit metadata information for some points.

Resolution: The algorithm to extract metadata has been corrected (see attachment "Analysis"). The source code file PGS_EPH_GetEphMet.c was altered.

NCR ID: ECSed09376

Title: PGS_PC_GetUniversalRef tool dumps when input pointer > 255 (HP only)

Severity: 3

Description: PGS_PC_GetUniversalRef tool core dumps when the input pointer attribute exceeds 255 characters. This only occurs on the HP platform (relbhpcs). The piece of the PCF file causing this is as follows:

```
# The following are to test long URLs. NCR ECSed07731. #  
# URL that longer then 256. This works, but might not in the future. #  
4221|modis.v1999_017|||modis.v1999_017_uref_with_a_very_long_path_na  
me_too_see_i  
f_the_toolkit_can_handle_it_that_is_so_long_that_it_takes_lots_of_thinks_to  
_say_  
to_fill_the_line_all_the_way_out_to_the_very_end_that_is_all_256_character  
s_that  
_are_allow_as_an_universal_reference_is_allowed_to_see_if_a_line_that_300  
_charac  
ters_will_cause_an_error_v1|modis.attr1999_017|2
```

NOTE: This test was put in place to test and verify ECSed07731.

Resolution: The test scenario uses a Universal Reference greater than what the Toolkit documents is the largest size that should be used. URs are generated by ECS (i.e. this is not something that users (ITs) are free to define/configure on their own). Due to the nature of C character strings the Toolkit cannot really enforce proper behavior when encountering excessively long strings.

The test case should not use the long string it is currently using since this is not testing a realistic scenario.

The test case should be altered (see attachent "Analysis"); the problem will not manifest.

NCR ID: ECSed09386

Title: Append a data type to the value Node of unset attribute

Severity: 3

Description: In order to define the proper data type in the TYPE parameter for those unset attribute values, that were written out on the HDF-EOS/non HDF-EOS metadata file with the string "NOT SET" for Data Location is PGE, "NOT SUPPLIED" for Data Locataion is MCF, and "NOT FOUND" for Data Location is NONE no matter which data type it belong to, when calling the function PGS_MET_ConvertToMCF() to convert a HDF-EOS/non HDF-EOS metadata file to be a .MCF that will be similiar to a Metadata Configuration file to be used to initialize the memory for the contents of the MCF to provide a basis for setting and checking metadata parameter values, the different string should be defined for different type of data for unset attribute. The function PGS_MET_CheckAttr() that was designed to be used by the function PGS_MET_Write() to check that all the mandatory metadata is set prior to being written to the product file become necessary to make this kind of modification for unset attributes.

Resolution: Modified code to define different strings for different types of data for unset attributes instead of defining the strings: "NOT SET" for Data Location PGE, "NOT SUPPLIED" for Data Location MCF, and "NOT FOUND" for Data Location NONE no matter which data type it belongs to

NCR ID: ECSed09394

Title: The value was supposed to be an INTEGER and not STRING

Severity: 3

Description: "...There is only one problem. In the .met file, there could be case where we have a metadata object whose type was, lets say INTEGER, but the vales is "NOT SET", a string. You have no way of knowing from the .met file that the value was supposed to be an INTEGER and nor STRING. When I wrote the routine, the intention was to simply use PGS_MET_Init and PGS_MET_Write on the converted MCF. I think user should be madse aware of this fact...."

Resolution: Added code to remove the VALUE parameter from the aggregate Node if attached value node containing any one of the following strings:

"NOT SET:STRING", "NOT SET:INTEGER", "NOT SET:DOUBLE", "NOT SET:DATETIME", "NOT SET:DATE", "NOT SET:TIME", "NOT SUPPLIED:STRING", "NOT SUPPLIED:INTEGER", "NOT SUPPLIED:DOUBLE", "NOT SUPPLOIED:DATETIME", "NOT

SUPPLIED:DATE", "NOT SUPPLIED:TIME", "NOT FOUND: STRING", "NOT FOUND:INTEGER", "NOT FOUND:DOUBLE", "NOT FOUND:DATETIME", "NOT FOUND:DATE", or "NOT FOUND:TIME"

that was written out on the HDF-EOS/non HDF-EOS metadata file when attribute has not been set up with the proper value. And a TYPE parameter including the attached value node that contains any one of the following type of data:

"INTEGER", "STRING", "DOUBLE", "DATETIME", "DATE" or "TIME", will be attached to this aggregate Node.

NCR ID: ECSed09402

Title: 64-bit F90 programs receive "unsupported by architecture" error

Severity: 3

Description: When attempting to execute any F90 drivers in 64-bit mode, the error "...program not supported by this architecture" is received. The "-mips3" flag is missing from the FORTRAN compiler on relbsgi (R4400 chip).

Resolution: The Toolkit install script (INSTALL-Toolkit) was updated to ensure that the -mips3 flag is used with the f90 compiler when compiling in 64 bit mode on SGIs using the 4xxx chip.

NCR ID: ECSed09520

Title: MET tools should not allow writing of attribute if data location=MCF

Severity: 3

Description: The toolkit has in the past allowed PGEs to write metadata attributes where data location = MCF. This should not be allowed, since once the MCF is created from the ESDT, no one should change the attributes that define the MCF. And this potentially causes problems for the data server.

The Toolkit MET tools need to be changed to return an error if an attempt is made to write an attribute whose data location = MCF.

This has been confirmed with Cheryl Croft and Corey Boettcher from Science, Simon Cantrell from Ingest and Edson Fisher and Bob Hartranft from Data Server.

Resolution: Added code to generate the error message if the Data Location is MCF and user attends to set up the attribute value that already been set up

NCR ID: ECSed09525

Title: Move back modified functions to previous version

Severity: 3

Description: Based on the .MCF converted by the new function PGS_MET_ConvertToMCF will cause the problem of incompatible with the implemented data model; therefore, this new function will be removed off the clearcase. All the functions, PGS_MET_CheckAttr(), PGS_MET_GetSetAttr(), and PGS_MET_GetSetAttrF(), that already been modified because of the new function should be changed back to the previous version

Resolution: Developer:

1. Checked out functions, PGS_MET_Checkout(), PGS_MET_GetSetAttr(), and PGS_MET_GetSetAttrF()
2. Copied the previous version to overwrite the current version for function PGS_MET_CheckAttr()
3. Deleted code that added in order to make the new function PGS_MET_ConverToMCF() can convert a .met file to .MCF for function PGS_MET_GetSetAttr() and PGS_MET_GetAttrF()
4. Checked in all three functions

Tester:

Verified that the previous versions of the tools PGS_MET_Checkout(), PGS_MET_GetSetAttr(), and PGS_MET_GetSetAttrF() were restored in ClearCase and will be delivered.

NCR ID: ECSed06194

Title: Very minor differences in the L0 drivers on the Power Challenge

Severity: 4

Description: On the Power Challenge getting minor differences in the L0 drivers

The output and sample files are at

/data3/ecs/OPS/CUSTOM/bin/scf_64f77/TOOLKIT/test/test_drivers/IO/L0

Resolution: The problem with the FORTRAN test driver PGS_IO_L0_Driver_f is with the test driver function packet_number(). This function does not properly parse packet buffers to determine the packet number.

By replacing the code:

```
integer function packet_number(data_packet)
character*(*) data_packet
integer mask
mask = 64
packet_number = mod(ichar(data_packet(3:3)),mask)
packet_number = packet_number*256 + ichar(data_packet(4:4))
```

```
return
end
```

with the code:

```
integer function packet_number(data_packet)
integer    data_packet
integer    mask
mask = 16384
    packet_number = mod(temp, mask)
return
end
```

the driver produced the same results as the C driver and as the sample output.

NCR ID: ECSed07278

Title: L0 AM get files times tool does not match EDOS ICD

Severity: 4

Description: This is Toolkit User Log problem number 970521. The ASTER team in Japan has discovered a problem with the Level 0 tools. The L0 tools will not properly parse an EDOS Construction Record if the Construction Record indicates that the data set to which it refers contains files with missing packets. This cannot happen using the L0sim simulator delivered with the Toolkit, but it does need to be fixed.

Resolution: The following change was made in
\$PGSSRC/IO/L0/PGS_IO_L0_GetEOSAMfileTimes.c:

line 195 changed from:

```
offset += 44*(PGS_IO_L0_BYTEtoINT(construction_record+offset, 4));
      ^^
```

to:

```
offset += 48*(PGS_IO_L0_BYTEtoINT(construction_record+offset, 4));
      ^^
```

NCR ID: ECSed07280

Title: MET function modifying constant string

Severity: 4

Description: We have discovered that one MET function was modifying an input constant string, without making a copy first: PGS_MET_NameAndClass.c This causes a core dump using the gcc compiler, but not using any of our supported compilers.

Resolution: Fixed the coding to prevent the metadata name, one input parameter that users provide as the attribute name to be set with the value, from being changed.

file changed:

/ecs/formal/TOOLKIT/src/MET/support/PGS_MET_NameAndClass.c

NCR ID: ECSed07281

Title: Search for attribute in empty group does not return an error

Severity: 4

Description: If a search for an attribute is attempted in an empty group, PGS_S_SUCCESS is returned instead of an error.

The affected functions are:

\$PGSHOME/src/MET/support/PGS_MET_SearchAttr.c

\$PGSHOME/src/MET/support/PGS_MET_SearchAttrF.c

Resolution: We have modified the code to check for an empty group and return an error.

files changed:

\$PGSHOME/src/MET/support/PGS_MET_SearchAttr.c

\$PGSHOME/src/MET/support/PGS_MET_SearchAttrF.c

NCR ID: ECSed07580

Title: remove predicted leap seconds from Toolkit code

Severity: 4

Description: The Toolkit contains the ability to use predicted leap seconds. That is, estimations of what the leap seconds will be far into the future. These predicted leap seconds were being extracted from US Naval Observatory estimates of Earth rotation in the far future. Recently, however, the Naval Observatory has stated that they do not recommend or support predictions of leap seconds. Actual leap seconds are generally announced almost 6 months in advance. Predictions beyond the actual leap seconds are deemed too unreliable.

Also, as ECS approaches actual production, it will be important that the Toolkit only support accurate production quality support data, such as leap seconds. (To prevent any production being done with inaccurate numbers). The original inclusion of far future "predictions" supported some user simulations, but are dangerous to have around in a production environment.

Accordingly, the predicted leap seconds capability needs to be removed from the Toolkit.

Resolution: The leap seconds file has o have its "tail" removed. The function that updates the leap seconds file has to be reworked not to create predicted ones. All functions accessing the leap seconds data have to be reworked so as not to look for predicted leap seconds. The primary such function, PGS_TD_LeapSec.c must be rewritten to as to give a return status indicating that the requested time is out of the range of the Table. Because the intervals are not predictable, the header , which indicates when the leap seconds file was last verified against the Naval Observatory data, must be checked. If it has not been rewritten within the previous 6 months to the requested time, an out-of-range return value will be given.

NCR ID: ECSed08559

Title: Earth Rotation Rate

Severity: 4

Description: The Tools PGS_CSC_ECIttoECR() and PGS_CSC_ECRtoECI() use a nominal Earth rotation rate 0.00007291151467 radians/s to transform velocities, based on the Explanatory Supplement to the Astronomical Almanac and the USNO software "NOVAS". Recently the International Earth Rotation Service (IERS) and the International Astronomical Union (IAU) have adopted the slightly smaller value 0.00007291151 radians pere second. This actual instantaneous value can vary by at least this difference due to geophysical events, but it is desirable to change to the slightly smaller rotation rate so as to be in better accord with the gradual slowing of the Earth in the next few decades. We shall therefore change the built-in constant. Numerical answers for velocities transformed between ECR and ECI may come out different by << 1 mm/s for Earth points, somewhat larger, but still inconsequentially changed for planets and distant objects.

Resolution: added a #define of Earth rotation rate at IERS value

This line appears as:

```
#define EARTH_ROTATE_RATE 0.000072921151 /* IERS Value as of
1997 */
```

in line #422 of PGS_CSC_ECRtoECI.c

and in line #439 of PGS_CSC_ECIttoECR.c

NCR ID: ECSed08854

Title: Excessive logging by PC tools

Severity: 4

Description: Excessive "warning" messages are being logged in the Toolkit status log file. The PC tools issue a warning any time a directory is not explicitly specified on a line in the PCF which represents a file.

e.g.

101|fileName||||1

causes a warning message to be printed in the status log file when the logical ID 101 is accessed by a users source code while

101|fileName|directoryName||||1

does not.

This is a normal occurrence and should not be reported in the statuslog file.

Resolution: Logging of warnings was removed from the function PGS_PC_GetPCSDDataGetRequest() (in the file PGS_PC_GetRequest.c). This functionality is handled by higher level PC routines.

NCR ID: ECSed08855

Title: Make dependencies do not work properly

Severity: 4

Description: Make dependencies do not work properly for Toolkit makefiles. The Toolkit makefiles should take advantage (as much as possible) of the dependency feature of the "make" command. This would reduce compile time for developers and allow the Configuration Management team to begin nightly builds of the Toolkit.

Resolution: The Toolkit makefiles have been made more conducive to iterative builds and updates. This should allow for more efficient development procedures and CM updates.

NCR ID: ECSed08857

Title: chkeph reports ALL s/c as "unsupported"

Severity: 4

Description: The binary executable "chkeph", which is used to check Toolkit formatted spacecraft ephemeris and attitude files, reports ALL spacecraft as being unsupported.

The output of this tool looks like (e.g.):

EOS_AM1_Ephemeris_1997-05-10T22:00:00.eph:

spacecraft ID: EOSAM1 (unknown)

start time: 137455203.000000 (1997-05-10T22:00:00.000000)

stop time: 137462399.000000 (1997-05-10T23:59:56.000000)

time interval: 2.000000

total records: 3599

checking record: 0003599 ... OK.

The output SHOULD look like:

```
EOS_AM1_Ephemeris_1997-05-10T22:00:00.eph:
spacecraft ID: EOSAM1 (2222)
start time: 137455203.000000 (1997-05-10T22:00:00.000000)
stop time: 137462399.000000 (1997-05-10T23:59:56.000000)
time interval: 2.000000
total records: 3599
checking record: 0003599 ... OK.
```

Resolution: The section of code that read:

```
if (returnStatus != PGS_S_SUCCESS)
{
    spacecraftTag = 0;
}

if (spacecraftTag != 0)
{
    printf(" spacecraft ID: %s (%d)\n",fileHeader.spacecraftID,
        scTagInfo.spacecraftTag);
}
else
{
    printf(" spacecraft ID: %s (unsupported)\n",
        fileHeader.spacecraftID);
}
```

has been replaced with code that reads:

```
if (returnStatus == PGS_S_SUCCESS)
{
    printf(" spacecraft ID: %s (%d)\n",fileHeader.spacecraftID,
        scTagInfo.spacecraftTag);
}
else
{
```

```

        printf(" spacecraft ID: %s (unsupported)\n",
               fileHeader.spacecraftID);
    }

```

NCR ID: ECSed08860

Title: Function prototypes should use "void"

Severity: 4

Description: Functions with no calling parameters should be declared with the "void" keyword in the function prototype, e.g.:

```
PGSt_SMF_status PGS_Function();
```

should be:

```
PGSt_SMF_status PGS_Function(void);
```

Resolution: The only file affected by this is PGS_MET.h. In this file the line:

```
PGS_MET_Remove(void);      /* Removes MCF after it is written to HDF
*/
```

was replaced with:

```
PGS_MET_Remove();          /* Removes MCF after it is written to HDF */
```

NCR ID: ECSed08863

Title: udunits package out of date

Severity: 4

Description: The version of the udunits package use by the Toolkit is 1.4. Version 1.11.5 is available. The version used by the Toolkit is cumbersome and requires constant special fixes to compile. The new version may correct this.

Resolution: The udunits package has been updated to version 1.11.5.

NCR ID: ECSed08903

Title: Unreachable line in PGS_CUC_Cons()

Severity: 4

Description: In the file \$PGSHOME/src/CUC/PGS_CUC_Cons.c are the following two lines (243, 244):

```
return PGSCUC_E__ERROR;
```

```
cuc_agg = RemoveAggregate(cuc_agg);
```

It is not possible for these second line to be executed. These lines should presumably read:

```
cuc_agg = RemoveAggregate(cuc_agg);
return PGSCUC_E__ERROR;
```

as they do in several other places in the code.

This problem was detected during compilation by turning on all flags. Line 244 was flagged as one that has no path to it.

Resolution: RemoveAggregate() is called before the function returns to its caller (see attachment "Problem").

NCR ID: ECSed08908

Title: Some DEM functions did not return error message PGSMEM_E_NO_MEMORY

Severity: 4

Description: After memory allocation functions should return error message if memory cannot be allocated. Some DEM functions check for availability of memory, but does not report PGSMEM_E_NO_MEMORY if failure occurs.

Resolution: The lines similar to the following (which is for the file PGS_DEM_Subset.c and the parameter getInfo):

```
sprintf(dynamicMsg, "Error allocating memory for "
        "getInfo");
statusSmf = PGS_SMF_SetDynamicMsg(PGSMEM_E_NO_MEMORY,
        dynamicMsg,
        "PGS_DEM_Subset()");
statusError = PGSMEM_E_NO_MEMORY;
```

were included at points where it is checked for the non-availability of memory in files

```
PGS_DEM_GetPoint.c
PGS_DEM_RecursiveSearchDeg.c
PGS_DEM_RecursiveSearchPix.c
PGS_DEM_ReplaceFillPointsFlt32.c
PGS_DEM_ReplaceFillPointsInt8.c
PGS_DEM_Subset.c
```

NCR ID: ECSed08980

Title: TK headers need #ifdef __cplusplus

Severity: 4

Description: Many Toolkit header files contain the
#ifdef __cplusplus

construct commonly used to allow C++ to access C routines. Some Toolkit headers do not have this construct however. The headers should be consistent. The lack of this C++ "binding" has already caused a problem for the Data Server group which uses C++ AND uses the Toolkit. This problem was reported by C++ users of the Toolkit. The instrument teams did not experience this problem since they do not use the C++ interface. Further visual inspection showed that several modules had this problem.

Resolution: The proper syntax was added to each header file that was lacking it. Namely the constructs:

```
#ifdef __cplusplus
extern "C" {
#endif
#ifdef __cplusplus
}
```

were added around all function declarations in the header files.

NCR ID: ECSed08981

Title: INSTALL scripts need revision

Severity: 4

Description: The INSTALL script wording when querying for HDF and HDF-EOS installation uses potentially confusing language (complaints have been received from users).

The INSTALL script asks:

"Pathname where directory HDF4.1r1 is located..."

when it wants the directory upto but not including the actual HDF installation directory. However, it asks:

"Pathname where HDF-EOS2.0v1.00 is located..."

when it wants the directory upto AND INCLUDING the HDF-EOS installation directory.

A minor issue, but ought to be fixed.

Resolution: The INSTALL script has been modified so that the queries for HDF and HDF-EOS installation directories are now:

Pathname where HDF4.1r1 is installed [<default_path>]

and

Pathname where HDF-EOS2.0v1.00 is installed [<default_path>]

respectively.

In both cases the user should provide the path upto and including the top level directory of these installations. This is different than the behavior of the HDF query in previous version of the Toolkit but the if a user assumes the old behavior (provides the path upto but NOT including the top level HDF directory) the INSTALL script will behave the same way it has in previous versions (i.e. it is backwards compatible).

NCR ID: ECSe09195

Title: DEM tool pgs_dem_getpoint has problem in getiing data for elevation

Severity: 4

Description: In fortran90 when the hdf files are opened for two layers using pgs_dem_open, by defining numlayers=2, layerlist(1)=PGSd_DEM_ELEV and layerlist(2)=PGSd_DEM_WATER_LAND, and try to extract data for elevation and land/sea using pgs_dem_getpoint, the data extracted for elevation are not right. Since land/sea data are 1 Byte type integer and elevation data are 2 byte type integer, on sgi machine we get the warnning

Warning: Inconsistent datatype for arg 9 in call to PGS_DEM_GETPOINT during compilation, and incorrect data values for elevation during run time.

This problem does not exist if we use pgs_dem_open separately for each layer, extract the points for that layer using pgs_dem_getpoint, and close the files using pgs_den_close.

Also the problem does not exist for c codes.

The problem reported above only occurs for f90 in old 32 bit sgi. There is no such a problem with f90 in new 32 bit sgi.

Resolution: Besides other changes since April to the DEM source codes, Alexis zubrow added dataType to PGSd_DEM_INFO (July 3, 1997) in PGS_DEM_Lookup.c to take care of different data types for different layers. The test code using new toolkit libraries in

/net/htsc/pgs/tk5.2.1/TOOLKIT/lib

extracted correct results both at relbsgi machine and user's sgi machine at mop1.eos.ucar.edu.

Sixty lines were added to PGS_DEM_Lookup.c

NCR ID: ECSe06154

Title: PGS_DEM_GetQualityData not availablle for SCF B.0 Toolkit 5.2

Severity: 5

Description: PGS_DEM_GetQualityData is not available for the present release. Have not received Source, Quality or Geoid data from EDC (the data producer). Not able to verify exact format, data type, and structure of quality and source data.

Resolution: added PGS_DEM_GetQualityData.c file to DEM toolkit.

NCR ID: ECSed07279

Title: Logical ID in PCF template is outside reserved range

Severity: 5

Description: One logical ID for a file used by the Toolkit was placed in the B.0 PCF template with a number outside the range reserved for Toolkit use (10000- 10999):

```
11001|udunits.dat|~/database/common/CUC|||1
```

Resolution: The valid logical ID of 10302 was chose to replace the invalid value of 11001. Line 46 of the file PGS_CUC.h was changed from:

```
#define PGSd_UDUNITS_DAT 11001
```

```
^^^^^
```

to:

```
#define PGSd_UDUNITS_DAT 10302
```

```
^^^^^
```

Line 362 of the file \$PGSRUN/PCF.relB0.template was changed from:

```
11001|udunits.dat|~/database/common/CUC|||1
```

```
^^^^^
```

to:

```
10302|udunits.dat|~/database/common/CUC|||1
```

```
^^^^^
```

NCR ID: ECSed09374

Title: Land/sea mask identifiers added to DEM tools.

Severity: 5

Description: Users requested identifiers for the land/sea mask data, so that the numbers associated with the data are not hard wired to their code.

Resolution: The following identifiers added to PGS_DEM.h file

```
#define PGS_DEM_SHALLOW_WATER      0
```

```
#define PGS_DEM_LAND                  1
```

```
#define PGS_DEM_SHORELINE            2
```

```
#define PGS_DEM_SHALLOW_INLAND_WATER  3
```

```
#define PGS_DEM_EPHEMERAL_WATER      4
```

```
#define PGS_DEM_DEEP_INLAND_WATER    5
```

```
#define PGS_DEM_MODERATE_OCEAN       6
```

```
#define PGS_DEM_DEEP_OCEAN           7
```

and the following lines added to PGS_DEM.f file

```
integer PGS_DEM_SHALLOW_WATER  
parameter (PGS_DEM_SHALLOW_WATER=0)
```

```
integer PGS_DEM_LAND  
parameter (PGS_DEM_LAND=1)
```

```
integer PGS_DEM_SHORELINE  
parameter (PGS_DEM_SHORELINE=2)
```

```
integer PGS_DEM_SHALLOW_INLAND_WATER  
parameter (PGS_DEM_SHALLOW_INLAND_WATER=3)
```

```
integer PGS_DEM_EPHEMERAL_WATER  
parameter (PGS_DEM_EPHEMERAL_WATER=4)
```

```
integer PGS_DEM_DEEP_INLAND_WATER  
parameter (PGS_DEM_DEEP_INLAND_WATER=5)
```

```
integer PGS_DEM_MODERATE_OCEAN  
parameter (PGS_DEM_MODERATE_OCEAN=6)
```

```
integer PGS_DEM_DEEP_OCEAN  
parameter (PGS_DEM_DEEP_OCEAN=7)
```

In addition PGSd_DEM_FILLVALUE and PGSd_DEM_NO_FILLVALUE which are defined (as -9999 and -8888) in PGS_DEM.h, were added to PGS_DEM.f, so that fortran users have access to these flags.

NCR ID: ECSed09506

Title: Minor output differences for PGS_SMF_EventLogger on SGI

Severity: 5

Description: The PGS_SMF_EventLogger tool is giving minor output differences on the SGI platform in old 32-bit and new 32-bit modes. The differences seen are as follows in all instances where "<" indicates actual outputs and ">" indicates expected output:

PGS_SMF_EventLogger_Driver_c.diff

.....

PGS_SMF_EventLogger_Driver_c

> Message: SUCCESSFUL operation

PGS_SMF_EventLogger_Driver_c done

Resolution: The PGS_SMF_EventLogger drivers were reran and the problem no longer occurred. The original problem can probably be traced to a test driver script problem. This is not a Toolkit problem.

5.3 Release B.0 Toolkit Version 5.2.1 Non-Conformance Reports (Open Status)

The following NCRs are liens against the Toolkit 5.2.1 delivery:

NCR ID: ECSed00765

Title: Files are not being sent when running on the HP and IBM.

Severity: 3

Description: While running on the HP, trying to send files to either of the following:

1. Adriatic itself
2. bering.hitc.com
3. eos.hitc.com

the files don't get sent. It was tried inside and outside of clearcase, and when running the ftp command from the command line it works successfully.

The sun4, sgi and dec don't have any problems(ibm and sun5 are unavailable). This has been deferred.

NCR ID: ECSed00225

Title: Environment variable PGS_PC_INFO_FILE

Severity: 4

Description: This DR is purposely open to inform everyone that there is an inherent problem on the return status from almost all of the toolkits (IO, MEM, SMF, PC, etc.). The problem is due to not checking the return status from SMF toolkits such as

PGS_SMF_SetStaticMsg(),
PGS_SMF_SetUNIXMsg() etc.

PGS_SMFSetDynamicMsg(),

An example would be in MEM tools when trying to set the appropriate error messages by calling SMF, SMF routine detects some environment variable and appropriately returns PGSSMF_E_LOGFILE or PGS_E_ENV to the MEM caller routine.

Currently, the MEM routine does not check the return status and proceeds to return MEM specific status; this is the current design. The problem comes about when the user calls PGS_SMF_GetMsg(). The static buffer error message does not agree with the return status from the MEM tool because the SMF tool, upon detecting an error, has overridden it. At this juncture, we are not sure of the appropriate step to take: have all tools potentially return SMF related errors, which creates more confusion because the user doesn't know the real outcome of his call to the tool, or perform some coupling with the SDPS processing system to let them know what happened and let it take corrective action. These are design issue which must be further explored.

NCR ID: ECSed07450

Title: DEM tools error at international date line

Severity: 4

Description: If attempt to extract a region which crosses the international date line (180degrees W/E), the DEM tools will return an error. It is conceivable that such regions may be requested.

(Note: This is also caused by the Bilinear interpolation issue: NCR 6151.)

This has been deferred.

NCR ID: ECSed08922

Title: DEM: PGS_DEM_SortModels does not step to lower resolution when data

Severity: 4

Description: DEM: PGS_DEM_SortModels does not step to lower resolution when data is not available in higher resolution. (Note: This is caused by the Bilinear interpolation issue: NCR 6151.)

This has been deferred.

NCR ID: ECSed01005

Title: Warning messages during installation.

Severity: 5

Description: These warnings primarily come from shareware and freeware used by the Toolkit. We have decided not to modify this code to prevent it from becoming custom code. (This issue will be closed shortly.)

NCR ID: ECSed01037

Title: Some requirements are partially met or deferred

Severity: 5

Description: As of the Release B.0 SCF Toolkit 5.2 delivery April 1997, the only requirement not satisfied is PGSTK-0820, which asks for star positions. This capability is only needed by SOLSTICE, an instrument scheduled for launch in 2003. Implementation of this requirement has been deferred.**NCR ID:** ECSed06151

Title: DEM bilinear interpolation not available in SCF B.0 TOOLKIT5.2

Severity: 5

Description: DEM Tools presently will not support bilinear interpolation. Awaiting feed-back from instrument teams about particular algorithm to deal with following technical problems:

- 1) the issue of weighting pixels from 3 arc resolution versus data pixels from 30 arc resolution.
- 2) the number of pixels to iterate before progressing to the next, lower resolution data pixels.
- 3) boundary problems at the edge of large fill value section and at the geographic extent of the world.

This has been deferred.

NCR ID: ECSed09440

Title: DEC returning different output for PGS_PC_GetTempReferenceCom

Severity: 5

Description: The PGS_PC_GetTempReferenceCom tool returns different values for the "Existence Flag" on the DEC platform only as follows where "<" is actual and ">" is expected:

Appendix A. Build/Installation Instructions

Build/installation instructions for Release B.0 Toolkit 5.2.1 are located in Section 5 of the Release B.0 SCF Toolkit Users Guide (333-CD-004-001), and the README file available with the Toolkit for delivery.

This page intentionally left blank.

Appendix B. Special Operating Instructions

The test drivers are provided "AS IS" without warranty of any kind. They are provided for example purposes only. The following disclaimer applies to the README files provided with the Test Drivers. These *readme files have not been verified. They do, however, contain valid and useful information concerning the setting of environment variables and compile instructions. However, should there be any errors or discrepancies between the instructions contained in the *README files and the Users Guide, the Users Guide should take precedence.

This page intentionally left blank.

Appendix C. System Limitations

None.

This page intentionally left blank.

Appendix D. User Feedback Procedures

Please refer to the Release B.0 SCF Toolkit Users Guide for a description of user feedback procedures.

Appendix E. Public Software Disclaimer Notice

This package, i.e., cfortran.h, and the cfortran.h example programs are property of the author who reserves all rights. This package and the code it produces may be freely distributed without fees, subject to the following restrictions:

- You must accompany any copies or distribution with this (unaltered) notice.
- You may not receive money for the distribution or for its media (e.g., tape, disk, computer, paper).
- You may not prevent others from copying it freely.
- You may not distribute modified versions without clearly documenting your changes and notifying the author.
- You may not misrepresent the origin of this software, either by explicit claim or omission.

The intent of the above terms is to ensure that the cfortran.h package not be used for profit making activities unless some royalty arrangement is entered into with its author.

This software is provide "as is" without warranty or any kind, either expressed or implied. The entire risk as to the quality and performance of the software is with you. Should the software prove defective, you assume the cost of all necessary servicing, repair or correction. The author is not responsible for any support or service of the cfortran.h package.
